

Helminth Records from Eleven Species of *Emoia* (Sauria: Scincidae) from Oceania¹

Stephen R. Goldberg,² Charles R. Bursey,³ and Robert N. Fisher⁴

Abstract: As part of an ongoing study of the biogeography of helminth parasites of lizards from Oceania, 53 specimens of *Emoia* (11 species) were examined, as follows: *E. atrocostata*, *E. boettgeri*, *E. caerulocauda*, *E. cyanogaster*, *E. cyanura*, *E. impar*, *E. nigra*, *E. nigromarginata*, *E. ponapea*, *E. sanfordi*, *E. trossula*. One species of Digenea, *Paradistomoides gregarium*, and six species of Nematoda, *Hedruris hanleyae*, *Maxvacchonia chabaudi*, *Parapharyngodon maplestoni*, *Physalopteroides arnoensis*, *Spauligodon gehyrae*, and *Moaciria* sp. indet., were found. These helminths have been reported previously from other lizard species. Seventeen new host records and eight new locality records are reported.

AS PART OF AN ongoing investigation of the biogeography of helminth parasites of lizards in Oceania, we identified helminths from a collection of skinks (*Emoia* spp.) from Belau, Federated States of Micronesia, Fiji, Tonga, and Vanuatu. The genus *Emoia* consists of at least 72 species that range from Southeast Asia through the Indo-Australian Archipelago and Oceania (Brown 1991). To our knowledge, only *Emoia cyanura*, *E. nigra*, and *E. samoensis* have previously been reported to harbor helminths (Goldberg and Bursey 1991, Goldberg et al. 2000). The purpose of this paper is to add helminths from 11 species of *Emoia* to the checklist of endoparasites for lizards from Oceania and to ascertain their distribution on the islands of Oceania. The checklist of endoparasites for lizards from Oceania began with the summaries of helminthological data on geckonid and scincid lizards by Goldberg et al. (1998, 2000) and Goldberg and Bursey (2002).

MATERIALS AND METHODS

Eleven species of *Emoia* ($n = 53$) from Oceania were examined, as follows: *E. atrocostata* ($n = 1$, Kobasang Island, Belau, $7^{\circ} 30' N$, $134^{\circ} 30' N$); *E. boettgeri* ($n = 1$, Pohnpei Island, Federated States of Micronesia, $9^{\circ} 0' N$, $150^{\circ} 0' E$); *E. caerulocauda* ($n = 8$, Efate Island, Vanuatu, $15^{\circ} 0' S$, $168^{\circ} 0' E$); *E. cyanogaster* ($n = 2$, Efate Island, Vanuatu); *E. cyanura* ($n = 9$; 4 from the Kingdom of Tonga, $19^{\circ} 50' S$, $174^{\circ} 30' W$; 1 from Pohnpei Island, Federated States of Micronesia; 4 from Nanuku Island, Fiji, $16^{\circ} 35' S$, $179^{\circ} 08' E$); *E. impar* ($n = 5$; 4 from Efate Island, Vanuatu; 1 from Ugaga Island, Fiji, $18^{\circ} 22' S$, $178^{\circ} 13' E$); *E. nigra* ($n = 11$, Kingdom of Tonga); *E. nigromarginata* ($n = 10$, Efate Island, Vanuatu); *E. ponapea* ($n = 1$, Pohnpei Island, Federated States of Micronesia); *E. sanfordi* ($n = 1$, Efate Island, Vanuatu); *E. trossula* ($n = 4$, Kingdom of Tonga). Lizards from the Kingdom of Tonga were collected in 1972 and are deposited in the Museum of the South Pacific, Suva, Fiji. *Emoia atrocostata*, *E. boettgeri*, and *E. ponapea* were collected in 1991 and are deposited in the California Academy of Sciences, San Francisco. All other *Emoia* were collected in 1993 and are deposited in the United States National Museum, Washington, D.C.

Lizards were dissected shortly after capture; helminths were removed and placed in vials of 70% ethanol; the carcasses were then preserved in 10% formalin and subsequently

⁴ U.S. Geological Survey, 5745 Kearny Villa Road, Suite M, San Diego, California 92123.

stored in 70% ethanol. For lizards from the Kingdom of Tonga, the esophagus, stomach, and small and large intestines were opened and separately searched for helminths under a dissecting microscope. From the other localities, only stomachs were examined. The helminths were examined in 2001, at which time the nematodes were identified after clearing in a drop of glycerol under a cover-slip on a microscope slide, and the digenleans were stained with hematoxylin and studied as whole mounts.

RESULTS

We found one species of Digenea, *Paradistomoides gregarium* (Dicrocoeliidae), and six species of Nematoda: *Hedruris hanleyae* (Hedruridae), *Maxvachonia chabaudi* (Cosmocercidae), *Moaciria* sp. indet. (Heterakidae), *Parapharyngodon maplestoni* (Pharyngodondidae), *Physalopteroides arnoensis* (Physalopteridae), and *Spauligodon gehyrae* (Pharyngodontidae). Prevalence (percentage of host species infected by a helminth species) and mean intensity ± 1 SD (number of individuals of a helminth species divided by number of infected hosts) are given in Table 1. Voucher specimens of the helminths were deposited in the United States National Parasite Collection (USNPC), Beltsville, Maryland: *Emoia atrocostata* (*Paradistomoides gregarium*, USNPC 93732); *Emoia boettgeri* (*Hedruris hanleyae*, USNPC 93733; *Moaciria* sp. indet., USNPC 93734); *Emoia caeruleocauda* (*Hedruris hanleyae*, USNPC 93735); *Emoia cyanogaster* (*Hedruris hanleyae*, USNPC 93736); *Emoia cyanura* (*Hedruris hanleyae*, USNPC 93737); *Emoia impar* (*Hedruris hanleyae*, USNPC 93738, 93739); *Emoia nigra* (*Hedruris hanleyae*, USNPC 93709); *Maxvachonia chabaudi*, USNPC 93715; *Parapharyngodon maplestoni*, USNPC 93710; *Physalopteroides arnoensis*, USNPC 93712); *Emoia nigromarginata* (*Hedruris hanleyae*, USNPC 93740); *Emoia pona-pea* (*Moaciria* sp. indet., USNPC 93741); *Emoia sanfordi* (*Hedruris hanleyae*, USNPC 93742); *Emoia trossula* (*Hedruris hanleyae*, USNPC 93727); *Physalopteroides arnoensis*, USNPC 93731; *Spauligodon gehyrae*, USNPC 93728).

DISCUSSION

Paradistomoides gregarium was originally described as *Paradistomum magnum* from specimens taken from the gall bladder of a gecko, *Hemidactylus frenatus*, collected in the Philippines by Tubangui (1928). However, *Paradistomum magnum* was preoccupied, and Tubangui (1929) changed the name to *Paradistomum gregarium*, which was assigned to its current genus by Travassos (1944). Synonyms include *Paradistomum brevis*, *P. geckorum*, *P. laruei*, *P. magnum*, *P. medicus*, *P. oroterminalis*, and *P. paloensis*. Additional hosts include the agamid lizards *Calotes versicolor*, *Hydrosaurus pustulatus*; the gekkonids *Cosymbotus platyurus*, *Gehyra mutilata*, *G. oceanica*, *Gekko* gecko, *Hemidactylus frenatus*, *H. brookii*, *Lepidodactylus guppyi*, *Nactus pelagicus*; the lacertid *Takydromus sexlineatus*; and the scincids *Emoia cyanurum*, *Lipinia noctua*, *Prasinohaema virens*, *Sphenomorphus solomonis* (Tubangui 1933, Fischthal and Kuntz 1967, Killick and Beverley-Burton 1982). *Emoia atrocostata* represents a new host record, and Belau is a new locality record.

Hedruris hanleyae was described from the stomach of a gecko, *Hemidactylus garnotii*, collected in the Cook Islands (Bursey and Goldberg 2000). Additional hosts include *Gehyra mutilata*, *G. oceanica*, *Hemidactylus frenatus*, *Lepidodactylus lugubris*, *L. moestus*, and *L. paurolepis*. *Emoia boettgeri*, *E. caeruleocauda*, *E. cyanogaster*, *E. cyanura*, *E. impar*, *E. nigra*, *E. nigromarginata*, *E. sanfordi*, and *E. trossula* represent new host records. Vanuatu and Federated States of Micronesia are new locality records.

Maxvachonia chabaudi was described from individuals pooled from nine species of lizards and one species of snake collected in Australia by Mawson (1972): the gekkonid *Phyllurus miltii*; the scincids *Ctenotus australis*, *C. labillardieri*, *C. leae*, *Egernia whitii*, *Eulamprus kosciuskoii*, *Hemiergis peronii*, *Lerista bougainvillii*, *Morethia lineoocellata*; and the elapid *Pseudonaja affinis*. Additional Australian hosts include the scincids *Ctenotus brooksi*, *C. leonhardii*, *C. pantherinus*, *C. quattuordecimlineatus*, *C. regius*, and *Egernia inornata* and the varanid *Varanus tristis* (Jones 1988, Goldberg and

Bursey 1995, 2000, Goldberg et al. 1999). Other reported hosts include *Emoia cyanura*, *Gehyra mutilata*, *G. oceanica*, *Lepidodactylus lugubris*, and *L. paurolepis* (Goldberg and Bursey 2002). *Emoia nigra* represents a new host record. The Kingdom of Tonga is a new locality record.

Moaciria is represented in Australia and Oceania by five species (Gibbons 1979, Jones 1979), four species described from snakes, namely *M. butleri*, *M. chondropythonis*, *M. et-nae*, *M. komodoensis*, and one species from a lizard, *M. sphenomorphi*. Species identification for *Moaciria* is based upon male caudal morphology. Only females were found in this study; thus identification to species was not attempted. *Emoia boettgeri* and *E. ponapea* represent new host records for *Moaciria*. Federated States of Micronesia is a new locality record.

Parapharyngodon maplestoni was originally described from the intestine of an agamid lizard, *Calotes versicolor*, collected in Burma by Chatterji (1933). Additional hosts include the agamid *Bronchocela cristatellus*; the anguid *Ophisaurus apodus*; the gekkonids *Hemidactylus flavoviridis*, *H. frenatus*; and the scincid *Glaucostrophus emigrans* (Goldberg and Bursey 2002). *Emoia nigra* is a new host record. The Kingdom of Tonga is a new locality record.

Physalopteroides arnoensis was described from the intestinal tract of the gecko *Lepidodactylus lugubris*, collected in the Republic of the Marshall Islands (Bursey and Goldberg 2001). Additional hosts include the gekkonids *Lepidodactylus moestus* and *L. paurolepis* (Goldberg and Bursey 2002). *Emoia nigra* and *Emoia trossula* represent new host records. The Kingdom of Tonga is a new locality record.

Spauligodon gebryae was described from the large intestine of the gecko *Gehyra oceanica*, collected in Guam (Bursey and Goldberg 1996). It has also been reported from *Lepidodactylus lugubris*. *Emoia trossula* represents a new host record. The Kingdom of Tonga is a new locality record.

Previous reports of helminths in species of *Emoia* include *Parapharyngodon kartana* (Pharyngodonidae) from *E. nigra* and *E. samoensis* and *Cylindrotaenia decidua* (Cestoda:

Nematotaeniidae), *Maxvachonia chabaudi*, and larvae of *Skrjabinoptera* sp. (Seuratidae) from *E. cyanura* (Goldberg and Bursey 1991, Goldberg et al. 2000). *Parapharyngodon kartana* was described from the scincid *Hemiergis peronii* by Johnston and Mawson (1941) and is also known from the agamid *Ctenophorus fionni*; the gekkonid *Christinus marmoratus*; and a scincid, *Lerista* sp. (Goldberg and Bursey 1991). *Cylindrotaenia decidua* was described from the scincid *Oligosoma nigriplantare* by Ainsworth (1985) and is also known from the scincid *Cryptoblepharus poecilopleurus* and the gekkonid *Gehyra oceanica* (Goldberg et al. 2000). Larvae of *Skrjabinoptera* were also reported from *Cryptoblepharus poecilopleurus* and *Lepidodactylus lugubris* (Goldberg et al. 2000).

The 10 species of helminths harbored by species of *Emoia* are generalists (species capable of infecting more than one species of lizard). For infection by these species, ecological factors related to egg survival may be more important than physiological (host) factors. Species of *Heduris*, *Moaciria*, *Parapharyngodon*, and *Spauligodon* have monoxenous life cycles and require the ingestion of an egg before infection can occur; species of *Physalopteroides* and *Skrjabinoptera* have heteroxenous life cycles that require the ingestion of the intermediate host; the life cycles of species of *Maxvachonia* are unknown, although other cosmocercoids produce larvae that utilize skin penetration as a route of infection (Anderson 2000). Trematodes and cestodes have heteroxenous life cycles (Roberts and Janovy 2005). Examination of ecological aspects of the natural history of species of *Emoia* may give a clue to the differential infection rates by the helminths reported here.

Helminthological examinations of additional species are required before the helminth diversity of lizard species from Oceania can be known and the distribution of helminths among the Pacific islands can be ascertained.

ACKNOWLEDGMENT

We thank Murray D. Dailey (Marine Mammal Center, Sausalito, California) for

the nematode samples from the Kingdom of Tonga.
