SOME INEQUALITIES IN $2-$INNER PRODUCT SPACES

Y.J. CHO, S.S. DRAGOMIR, A. WHITE, AND S.S. KIM

ABSTRACT. In this paper we extend some results on the refinement of Cauchy-Buniakowski-Schwarz's inequality and Aćzel's inequality in inner product spaces to $2-$inner product spaces.

1. Introduction

Let X be a real linear space of dimension greater than 1 and let $\|\cdot,\cdot\|$ be a real-valued function on $X \times X$ satisfying the following conditions:

(N_1) $\|x,y\| = 0$ if and only if x and y are linearly dependent;

(N_2) $\|x,y\| = \|y,x\|$;

(N_3) $\|\alpha x,y\| = |\alpha|\,\|x,y\|$ for any real number α;

(N_4) $\|x,y+z\| \leq \|x,y\| + \|x,z\|$.

$\|\cdot,\cdot\|$ is called a *$2-$norm* on X and $(X,\|\cdot,\cdot\|)$ *a linear 2–normed space* cf. [10]. Some of the basic properties of the 2-norms are that they are nonnegative, and $\|x,y+\alpha x\| = \|x,y\|$ for every x,y in X and every real number α.

For any non-zero $x_1,x_2,...,x_n$ in X, let $V(x_1,x_2,...,x_n)$ denote the subspace of X generated by $x_1,x_2,...,x_n$. Whenever the notation $V(x_1,x_2,...,x_n)$ is used, we will understand that $x_1,x_2,...,x_n$ are linearly independent.

A concept which is closely related to linear 2-normed space is that of 2 inner product spaces. For a linear space X of dimension greater than 1 let $(\cdot,\cdot\mid\cdot)$ be a real-valued function on $X\times X\times X$ which satisfies the following conditions:

(I_1) $(x,x\mid z)\geq 0; (x,x\mid z)=0$ if and only if x and z are linearly dependent;

(I_2) $(x,x\mid z)=(z,z\mid x)$;

(I_3) $(x,y\mid z)=(y,x\mid z)$;

(I_4) $(\alpha x,y\mid z)=\alpha(x,y\mid z)$ for any real number α;

(I_5) $(x+x',y\mid z)=(x,y\mid z)+(x',y\mid z)$.

$(\cdot,\cdot\mid\cdot)$ is called a *2-inner* product and $(X,(\cdot,\cdot\mid\cdot))$ a *2-inner product space* ([3]).

These spaces are studied extensively in [1], [2], [4]-[6] and [11]. In [3] it is shown that $\|x,z\|=(x,x\mid z)^{\frac{1}{2}}$ is a $2-$norm on $(X,\|\cdot,\cdot\|)$. Every $2-$inner product space will be considered to be a linear $2-$normed space with the $2-$norm

This paper has been supported in part by NON-DIRECTED RESEARCH FUND, Korea Research Foundation, 1996.

$\|x,z\| = (x,x \mid z)^{\frac{1}{2}}$. R. Ehret, [9], has shown that for any $2-$inner product space $(X,(\cdot,\cdot \mid \cdot))$, $\|x,z\| = (x,x \mid z)^{\frac{1}{2}}$ defines a 2-norm for which

$$(x,y \mid z) = \frac{1}{4}\left(\|x+y,z\|^2 - \|x-y,z\|^2\right), \tag{1.1}$$

$$\|x+y,z\|^2 + \|x-y,z\|^2 = 2\left(\|x,z\|^2 + \|y,z\|^2\right). \tag{1.2}$$

Besides, if $(X,\|\cdot,\cdot\|)$ is a linear $2-$normed space in which condition (1.2), being a 2-dimensional analogue of the parallelogram law, is satisfied for every $x,y,z \in X$, then a 2-inner product on X is defined on by (1.1).

For a 2-inner product space $(X,(\cdot,\cdot \mid \cdot))$ Cauchy-Schwarz's inequality

$$|(x,y \mid z)| \le (x,x \mid z)^{\frac{1}{2}} (y,y \mid z)^{\frac{1}{2}} = \|x,z\| \, \|y,z\|,$$

a $2-$dimensional analogue of Cauchy-Buniakowski-Schwarz's inequality, holds (cf. [3]).

2. Refinements of Cauchy-Schwarz's Inequality

Throughout this paper, let $(X,(\cdot,\cdot \mid \cdot))$ denote a $2-$inner product space with $\|x,z\| = (x,x \mid z)^{\frac{1}{2}}$, $\mathbf{R}$ the set of real numbers and $\mathbf{N}$ the set of natural numbers.

Theorem 2.1. *Let $x,y,z,u,v \in X$ with $z \notin V(x,y,u,v)$ be such that*

$$\|u,z\|^2 \le 2(x,u \mid z), \qquad \|v,z\|^2 \le 2(y,v \mid z). \tag{2.1}$$

Then, we have the inequality

$$\begin{aligned} &\left(2(x,u \mid z) - \|u,z\|^2\right)^{\frac{1}{2}} \left(2(y,v \mid z) - \|v,z\|^2\right)^{\frac{1}{2}} \\ &+ |(x,y \mid z) - (x,v \mid z) - (u,y \mid z) + (u,v \mid z)| \le \|x,z\| \, \|y,z\|. \end{aligned} \tag{2.2}$$

Proof. Note that

$$\left(m^2 - n^2\right)\left(p^2 - q^2\right) \le (mp - nq)^2 \tag{2.3}$$

for every $m,n,p,q \in \mathbf{R}$. Since

$$\begin{aligned} &|(x,y \mid z) - (x,v \mid z) - (u,y \mid z) + (u,v \mid z)|^2 \\ &= |(x-u,y-v \mid z)|^2 \le \|x-u,z\|^2 \, \|y-v,z\|^2 \\ &= \left(\|x,z\|^2 + \|u,z\|^2 - 2(x,u \mid z)\right)\left(\|y,z\|^2 + \|v,z\|^2 - 2(y,v \mid z)\right), \end{aligned}$$

by (2.3), we have

$$\begin{aligned} &|(x,y \mid z) - (x,v \mid z) - (u,y \mid z) + (u,v \mid z)|^2 \\ &\le \left\{\|x,z\| \, \|y,z\| - \left(2(x,u \mid z) - \|u,z\|^2\right)^{\frac{1}{2}} \left(2(y,v \mid z) - \|v,z\|^2\right)^{\frac{1}{2}}\right\}^2. \end{aligned} \tag{2.4}$$

On the other hand

$$0 \le \left(2(x,u \mid z) - \|u,z\|^2\right)^{\frac{1}{2}} \le \|x,z\|,$$

$$0 \le \left(2(y,v \mid z) - \|v,z\|^2\right)^{\frac{1}{2}} \le \|y,z\|,$$

which imply

$$\left(2\left(x,u\mid z\right)-\left\Vert u,z\right\Vert^{2}\right)^{\frac{1}{2}}\left(2\left(y,v\mid z\right)-\left\Vert v,z\right\Vert^{2}\right)^{\frac{1}{2}}\leq\left\Vert x,z\right\Vert\left\Vert y,z\right\Vert.$$

Therefore, from (2.4), we have the inequality (2.2). This completes the proof. ∎

Corollary 2.2. *Let $x,y,z,e\in X$ be such that $\left\Vert e,z\right\Vert=1$ and $z\notin V\left(x,y,e\right)$. Then*

$$\left|\left(x,y\mid z\right)\right|\leq\left|\left(x,y\mid z\right)-\left(x,e\mid z\right)\left(e,y\mid z\right)\right| +\left|\left(x,e\mid z\right)\left(e,u\mid z\right)\right|\leq\left\Vert x,z\right\Vert\left\Vert y,z\right\Vert. \tag{2.5}$$

Proof. If we put $u=\left(x,e\mid z\right)e$ and $v=\left(y,e\mid z\right)e$, then the conditions (2.1) hold. In fact,

$$\begin{aligned}2\left(x,u\mid z\right)-\left\Vert u,z\right\Vert^{2}&=2\left(x,\left(x,e\mid z\right)e\mid z\right)-\left\Vert\left(x,e\mid z\right)e,z\right\Vert^{2}\\&=2\left(x,e\mid z\right)\left(x,e\mid z\right)-\left(x,e\mid z\right)^{2}=\left(x,e\mid z\right)\left(x,e\mid z\right)\geq0.\end{aligned}$$

And similarly for the second condition in (2.1).

Moreover,

$$\begin{aligned}&\left|\left(x,y\mid z\right)-\left(x,v\mid z\right)-\left(u,y\mid z\right)+\left(u,v\mid z\right)\right|\\&=\left|\left(x,y\mid z\right)-\left(x,e\mid z\right)\left(y,e\mid z\right)-\left(x,e\mid z\right)\left(e,y\mid z\right)+\left(x,e\mid z\right)\left(y,e\mid z\right)\right|\\&=\left|\left(x,y\mid z\right)-\left(x,e\mid z\right)\left(e,y\mid z\right)\right|\end{aligned}$$

so, by Theorem 2.1, we have (2.5). ∎

Corollary 2.3. *Let $x,y,z\in X$ be such that $\left\Vert x,z\right\Vert^{2}\leq2,\left\Vert y,z\right\Vert^{2}\leq2$ and $z\notin V\left(x,y\right)$. Then*

$$\left|\left(x,y\mid z\right)\right|^{2}\left(2-\left\Vert x,z\right\Vert^{2}\right)^{\frac{1}{2}}\left(2-\left\Vert y,z\right\Vert^{2}\right)^{\frac{1}{2}} +\left|\left(x,y\mid z\right)\right|\left|1-\left\Vert x,z\right\Vert^{2}-\left\Vert y,z\right\Vert^{2}+\left(x,y\mid z\right)\right|^{2}\leq\left\Vert x,z\right\Vert\left\Vert y,z\right\Vert. \tag{2.6}$$

Proof. If we put $u=\left(x,y\mid z\right)y$ and $v=\left(y,x\mid z\right)x$, then the inequality (2.3) holds. Moreover, we have

$$\begin{aligned}&\left(2\left(x,u\mid z\right)-\left\Vert u,z\right\Vert^{2}\right)^{\frac{1}{2}}\left(2\left(y,v\mid z\right)-\left\Vert v,z\right\Vert^{2}\right)^{\frac{1}{2}}\\&=\left|\left(x,y\mid z\right)\right|^{2}\left(2-\left\Vert x,z\right\Vert^{2}\right)^{\frac{1}{2}}\left(2-\left\Vert y,z\right\Vert^{2}\right)^{\frac{1}{2}},\end{aligned}$$

$$\begin{aligned}&\left|\left(x,y\mid z\right)-\left(x,v\mid z\right)-\left(u,y\mid z\right)+\left(u,v\mid z\right)\right|\\&=\left|\left(x,y\mid z\right)\right|\left|1-\left\Vert x,z\right\Vert^{2}-\left\Vert y,z\right\Vert^{2}+\left|\left(x,y\mid z\right)\right|^{2}\right|.\end{aligned}$$

Therefore, by Theorem 2.1, we have the inequality (2.6). ∎

Theorem 2.4. *Let $x,y,z,e\in X$ be such that $\left\Vert e,z\right\Vert=1$ and $z\notin V\left(x,y,e\right)$. Then*

$$\left|\left(x,y\mid z\right)-\left(x,e\mid z\right)\left(e,y\mid z\right)\right|^{2} \leq\left(\left\Vert x,z\right\Vert^{2}-\left|\left(x,e\mid z\right)\right|^{2}\right)\left(\left\Vert y,z\right\Vert^{2}-\left|\left(y,e\mid z\right)\right|^{2}\right). \tag{2.7}$$

Proof. Consider a mapping $P:X\times X\times X\rightarrow\mathbf{R}$ defined by $P\left(x,y,z\right)=\left(x,y\mid z\right)-\left(x,e\mid z\right)\left(e,y\mid z\right)$ for every $x,y,z,e\in X$, having the properties:

(i) $P(x,x,z) \geq 0,$
(ii) $P(\alpha x+\beta x',y,z) = P(x,y,z)+\beta P(x',y,z),$
(iii) $P(x,y,z) = P(y,x,z).$

Then Cauchy-Schwarz's inequality

$$|P(x,y,z)|^2 \leq P(x,x,z)\,P(y,y,z) \tag{2.8}$$

holds.

Indeed, we observe that

$$0 \leq P(x+\alpha P(x,y,z)\,y, x+\alpha P(x,y,z)\,y, z)$$

$$= P(x,x,z)+2\alpha P(x,y,z)^2+\alpha^2 P(x,y,z)^2 P(y,y,z) \quad (\forall)\,\alpha\in\mathbf{R}.$$

It is well known that if $a \geq 0$ and

$$a\alpha^2+\beta\alpha+c \geq 0 \quad \text{for all } \alpha\in\mathbf{R},$$

then $\Delta = b^2-4ac \leq 0.$

Then by the above inequality we deduce

$$P(x,y,z)^4 \leq P(x,x,z)\,P(y,y,z)\,P(x,y,z)^2. \tag{2.9}$$

If $P(x,y,z)=0$ then (2.8) holds.

If $P(x,y,z)\neq 0$ then we can devide in (2.9) by $P(x,y,z)$ and obtain (2.8).

The theorem is thus proved. ∎

Remark 2.1. *By the inequalities* (2.3) *and* (2.7), *we have*

$$|(x,y\mid z)-(x,e\mid z)(e,y\mid z)|^2$$

$$\leq \left(\|x,z\|^2-|(x,e\mid z)|^2\right)\left(\|y,z\|^2-|(y,e\mid z)|^2\right)$$

$$\leq (\|x,z\|\,\|y,z\|-|(x,e\mid z)(e,y\mid z)|)^2.$$

Since $\|x,z\|\,\|y,z\| \geq |(x,e\mid z)(e,y\mid z)|$, we get

$$|(x,y\mid z)-(x,e\mid z)(e,y\mid z)| \leq \|x,z\|\,\|y,z\|-|(x,e\mid z)(e,y\mid z)|,$$

which yields the inequality (2.5).

Corollary 2.5. *Let $x,y,z,e\in X$ be such that $\|e,z\|=1$ and $z\notin V(x,y,e)$. Then*

$$\left(\|x+y,z\|^2-|(x+y,e\mid z)|^2\right)^{\frac{1}{2}} \tag{2.10}$$

$$\leq \left(\|x,z\|^2-|(x,e\mid z)|^2\right)^{\frac{1}{2}}+\left(\|y,z\|^2-|(y,e\mid z)|^2\right)^{\frac{1}{2}}.$$

Proof. If we define $S: X\times X\to\mathbf{R}$ by $S(x,z)=P(x,x,z)^{\frac{1}{2}}$ for every $x,y\in X$ and use the triangle inequality for $S(x,z)$, then we have (2.10). ∎

Corollary 2.6. *For every non-zero $x,y,z,u\in X$, with $z\notin V(x,y,u)$, we have*

$$\left|\frac{(x,y\mid z)}{\|x,z\|\,\|y,z\|}\right|^2+\left|\frac{(y,u\mid z)}{\|y,z\|\,\|u,z\|}\right|^2+\left|\frac{(u,x\mid z)}{\|u,z\|\,\|x,z\|}\right|^2 \tag{2.11}$$

$$\leq 1+2\left|\frac{(x,y\mid z)(y,u\mid z)(u,x\mid z)}{\|x,z\|^2\,\|y,z\|^2\,\|u,z\|^2}\right|.$$

For the proof of next theorem, we need the following lemma:

Lemma 2.7. *For every non-zero $x, y, z \in X$ with $z \notin V(x,y)$, we have*

$$(\|x,z\| + \|y,z\|) \left\| \frac{x}{\|x,z\|} - \frac{y}{\|y,z\|}, z \right\| \leq 2\|x-y,z\|. \tag{2.12}$$

Proof. Since

$$\frac{\|x,z\|}{\|y,z\|} + \frac{\|y,z\|}{\|x,z\|} \geq 2,$$

we have the inequality

$$\begin{aligned}(\|x,z\| + \|y,z\|)^2 - (x,y \mid z)\left(\frac{\|x,z\|}{\|y,z\|} + \frac{\|y,z\|}{\|x,z\|}\right) - 2(x,y \mid z) \\ \leq 2\|x,z\|^2 + \|y,z\|^2 - 4(x,y \mid z)\end{aligned}$$

which implies (2.12). ∎

Theorem 2.8. *For every non-zero $x, y, z \in X$ with $z \notin V(x,y)$ we have*

$$\begin{aligned}(\|x,z\| + \|y,z\|)^2 \left(\left\| \frac{x}{\|x,z\|} - \frac{y}{\|y,z\|}, z \right\|^2 + \left\| \frac{x}{\|x,z\|} + \frac{y}{\|y,z\|}, z \right\|^2 \right) \\ \leq 8\left(\|x,z\|^2 + \|y,z\|^2\right).\end{aligned} \tag{2.13}$$

Proof. By (2.12) we have

$$\begin{aligned}&(\|x,z\| + \|y,z\|)^2 \left(\left\| \frac{x}{\|x,z\|} - \frac{y}{\|y,z\|}, z \right\|^2 + \left\| \frac{x}{\|x,z\|} + \frac{y}{\|y,z\|}, z \right\|^2 \right) \\ \leq\ & 4\left(\|x-y,z\|^2 + \|x+y,z\|^2\right)\end{aligned}$$

and, by a 2−dimensional analogue of the parallelogram law, we get (2.13). ∎

Remark 2.2. *For some similar results in inner product spaces, see* [7].

3. Aćzel's Inequality

In this section, we shall point out some results in 2−inner product spaces in connection to Aćzel's inequality [12]. For some other similar results in inner products, see [8]. We note that the results obtained here, in 2−inner product spaces used different techniques as those in [8].

Theorem 3.1. *Let $(X, (\cdot,\cdot \mid \cdot))$ be a 2−inner product space, $M_1, M_2 \in \mathbf{R}$ and $x, y, z \in X$ such that*

$$\|x,z\| \leq |M_1|, \qquad \|y,z\| \leq |M_2|,$$

then

$$\left(M_1^2 - \|x,z\|^2\right)\left(M_2^2 - \|y,z\|^2\right) \leq (|M_1 M_2| - (x,y \mid z))^2. \tag{3.1}$$

Proof. Using the elementary inequality (2.3), we get

$$0 \leq \left(M_1^2 - \|x,z\|^2\right)\left(M_2^2 - \|y,z\|^2\right) \leq \left(|M_1 M_2| - \|x,z\|\,\|y,z\|\right)^2,$$

and by Cauchy-Schwarz's inequality,

$$0 \leq |M_1 M_2| - \|x,z\|\,\|y,z\| \leq |M_1 M_2| - (x,y \mid z)$$

implying (3.1). ∎

Corollary 3.2. *If $x, y, z \in X$, are such that $\|x,z\|, \|y,z\| \leq M, M > 0$, then we have the inequality*

$$0 \leq \|x,z\|^2 \|y,z\|^2 - (x,y \mid z)^2 \leq M^2 \|x-y,z\|^2 \tag{3.2}$$

which is a counterpart of Cauchy-Schwarz's inequality.

Another similar results to the generalization (3.1) of Aćzel's inequality is the following one

Theorem 3.3. *Let $(X, (\cdot,\cdot \mid \cdot))$ be a 2−inner product space, and $M_1, M_2 \in \mathbf{R}$ and $x, y, z \in X$ such that $\|x,z\| \leq |M_1|$, $\|y,z\| \leq |M_2|$. Then*

$$(|M_1| - \|x,z\|)^{\frac{1}{2}} (|M_2| - \|y,z\|)^{\frac{1}{2}} \leq |M_1 M_2|^{\frac{1}{2}} - |(x,y \mid z)|^{\frac{1}{2}}. \tag{3.3}$$

Proof. Applying (2.3) for $m = \sqrt{|M_1|}$, $p = \sqrt{|M_2|}$, $n = \sqrt{\|x,z\|}$, $q = \sqrt{\|y,z\|}$ and using Cauchy-Schwarz's inequality for 2−inner products we deduce (3.3). ∎

Corollary 3.4. *Suppose that $x, y, z \in X$ and $M > 0$ are such that $\|x,z\|, \|y,z\| \leq M$. Then we have the following converse of Cauchy-Schwarz's inequality*

$$0 \leq \|x,z\|\,\|y,z\| - |(x,y \mid z)| \tag{3.4}$$

$$\leq M\left(\|x,z\| + \|y,z\| - 2\,|(x,y \mid z)|^{1/2}\right).$$

Theorem 3.5. *Let $(\cdot,\cdot \mid \cdot)$ be a 2−inner product and $\{(\cdot,\cdot \mid \cdot)_i\}_{i\in\mathbf{N}}$ a sequence of 2−inner products satisfying*

$$\|x,z\|^2 > \sum_{i=0}^{\infty} \|x,z\|_i^2 \tag{3.5}$$

for all x, z, being linearly independent. Then we have the following refinemenet of Cauchy-Schwarz's inequality

$$\|x,z\|\,\|y,z\| - |(x,y \mid z)| \tag{3.6}$$

$$\geq \left[\sum_{i=0}^{\infty} \|x,z\|_i \sum_{i=0}^{\infty} \|y,z\|_i - |(x,y \mid z)|\right] \geq 0 \tag{3.7}$$

for all $x, y, z \in X$.

Proof. Let $n \in \mathbf{N}$ and $n \geq 1$. Define the mapping

$$(x,y \mid z)_n = (x,y \mid z) - \sum_{i=0}^{n} (x,y \mid z)_i, \qquad x, y, z \in X.$$

We observe, by (3.5), that the mapping $(\cdot,\cdot \mid \cdot)_n$ satisfies the properties

(i) $(x,x \mid z)_n \geq 0$,
(ii) $(\alpha x + \beta x', y \mid z)_n = \alpha (x,y \mid z)_n + \beta (x',y \mid z)_n$,

(iii) $(x, y \mid z)_n = (y, x \mid z)_n$
for every $x, x', y, z \in X$ and $\alpha, \alpha' \in \mathbf{R}$.

By a similar proof to that in Theorem 2.4, we can state Cauchy-Schwarz's inequality

$$(x, x \mid z)_n (y, y \mid z)_n \geq |(x, y \mid z)_n|^2, \quad x, y, z \in X,$$

that is

$$\left(\|x,z\|^2 - \sum_{i=0}^{n} \|x,z\|_i^2\right)\left(\|y,z\|^2 - \sum_{i=0}^{n} \|y,z\|_i^2\right) \tag{3.8}$$
$$\geq \left((x, y \mid z) - \sum_{i=0}^{n} (x, y \mid z)_i\right)^2 .$$

Using Aćzel's inequality [12]

$$\left(a^2 - \sum_{i=0}^{m} a_i^2\right)\left(b^2 - \sum_{i=0}^{m} b_i^2\right) \leq \left(ab - \sum_{i=0}^{m} a_i b_i\right)^2,$$

where $a, b, a_i, b_i \in \mathbf{R}$ for $i = 0, ..., m$; we can prove that

$$\left(\|x,z\| \|y,z\| - \sum_{i=0}^{n} \|x,z\|_i \|y,z\|_i\right)^2 \tag{3.9}$$
$$\geq \left(\|x,z\|^2 - \sum_{i=0}^{n} \|x,z\|_i^2\right)\left(\|y,z\|^2 - \sum_{i=0}^{n} \|y,z\|_i^2\right)$$

for all $x, y, z \in X$. Since, by Cauchy-Buniakowski-Schwarz's inequality

$$\|x,z\| \|y,z\| \geq \left(\sum_{i=0}^{n} \|x,z\|_i^2 \sum_{i=0}^{n} \|y,z\|_i^2\right)^{1/2} \geq \sum_{i=0}^{n} \|x,z\|_i \|y,z\|_i ,$$

then by (3.8) and (3.9) we deduce

$$\|x,z\| \|y,z\| - \sum_{i=0}^{n} \|x,z\|_i \|y,z\|_i$$
$$= \left| \|x,z\| \|y,z\| - \sum_{i=0}^{n} \|x,z\|_i \|y,z\|_i \right| \geq |(x, y \mid z)| - \sum_{i=0}^{n} |(x, y \mid z)_i|$$

which implies (3.6), by using the inequality

$$\|x,z\|_i \|y,z\|_i - |(x, y \mid z)_i| \geq 0.$$

The theorem is thus proved. ∎

The following corollaries are interesting as refinements of the triangle inequality for 2-norms generated by 2-inner products.

Corollary 3.6. *With the assumptions from Theorem, we have the following refinement of the triangle inequality*

$$(\|x,z\| + \|y,z\|)^2 - \|x+y,z\|^2$$

$$\geq \sum_{i=0}^{\infty} \left[\left(\|x, z\|_i + \|y, z\|_i \right)^2 - \|x + y, z\|_i^2 \right] \geq 0, x, y, z \in X.$$

Corollary 3.7. *Let $(.,. \mid .)_1, (.,. \mid .)_2$ be two 2-inner products such that*

$$\|x, z\|_2 > \|x, z\|_1$$

for all x, z being linearly independent in X. Then

$$\|x, z\|_2 \|y, z\|_2 - |(x, y \mid z)_2|$$
$$\geq \|x, z\|_1 \|y, z\|_1 - |(x, y \mid z)_1| \geq 0, x, y, z \in X.$$

Corollary 3.8. *Let $(.,. \mid .)_1, (.,. \mid .)_2$ be as above. Then*

$$\left(\|x, z\|_2 + \|y, z\|_2 \right)^2 - \|x + y, z\|_2^2$$

$$\geq \left(\|x, z\|_1 + \|y, z\|_1 \right)^2 - \|x + y, z\|_1^2 \geq 0, x, y, z \in X.$$
