**Random Breath Testing and their effectiveness revisited:
An Examination of RBT and Alcohol-Related Crash Data
from 2000-2011 across Australia.**

**Jason Ferris, Lorraine Mazerolle, Sarah Bennett,
Madonna Devaney - University of Queensland
Mark King, Lyndel Bates – CARRS-Q (QUT)**

Acknowledgements

QPS

- Assistant Commissioners Peter Martin
- Chief Superintendent Bob Gee
- Road Safety and Traffic Support Managers – Monique Grigg and Lisa-Marie O'Donnell

Collaborations with:

- All jurisdictions police service
- All jurisdictions department of main roads (and equivalent)
- AustRoads, South Australia

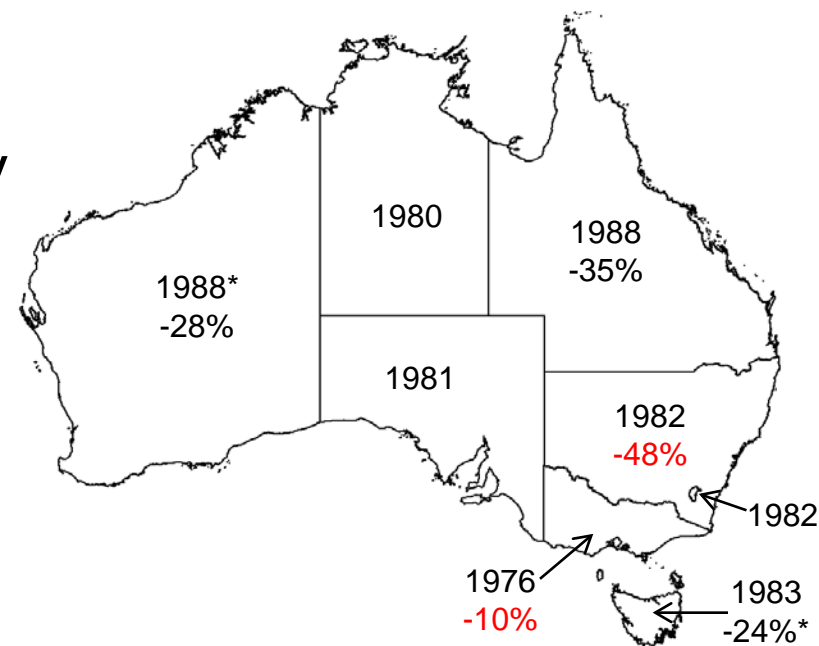

Overview of Presentation

- History of RBTs
- The predominant theory behind ‘effective’ RBTs
- Highlight initial findings from WA vs QLD comparison
- Situate these findings in the context of other state data
 - Monthly data
 - Yearly data
- Discussion of where to?

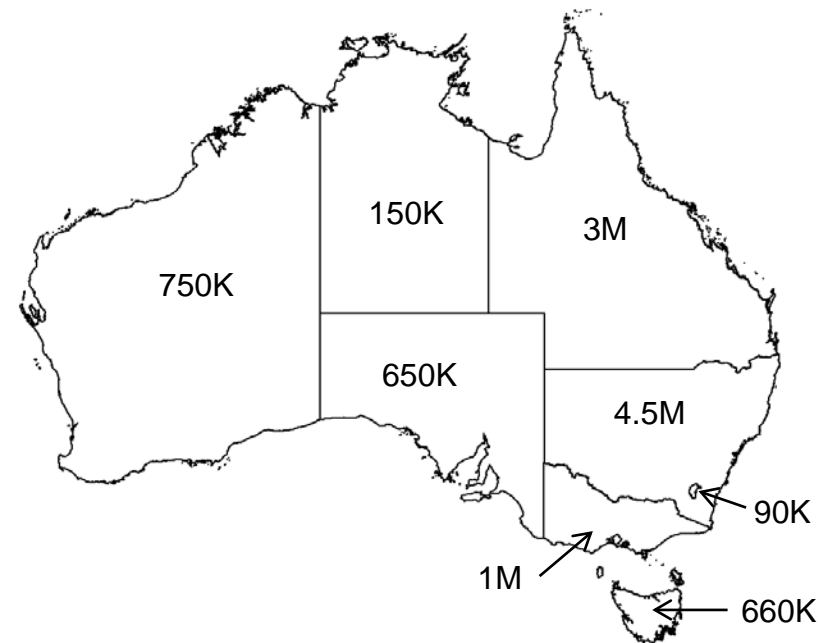

History of RBTs

- Prior to introduction of RBTs ~ 50% of drivers killed in a MVA had BAC over 0.05% g/mL
- First introduced in Victoria – 1976
- Reduction in fatalities at around roll out 10-50%
- RBTs – main drink-driving law enforcement tool
- 2000-2010 ~ 8m RBTs annually
- 2010 ~ 15m licenced drivers
- **Australian RBT:LD ratio 1:2**

RBT rate by state

- Most states do not have a mandatory rate of RBTs
- Annual RBTs - ratio - Annual number licenced drivers
 - NSW – 1:1* ratio has been increasing
 - VIC – 1:3
 - QLD – 1:1
 - WA – 1:3* no 'true' rate
 - SA – 1:2
 - ACT – 1:3
 - TAS – 1.4:1
 - NT – 1:1

Deterrence theory and RBTs

- Is based on one's decision-making processes – *does the benefits of the crime outweigh the costs of getting caught*

Deterrence theory and RBTs

- Is based on one's decision-making processes – *does the benefits of the crime outweigh the costs of getting caught*

Deterrence theory and RBTs

- Is based on one's decision-making processes – *does the benefits of the crime outweigh the costs of getting caught*

Deterrence theory and RBTs

- Is based on one's decision-making processes – *does the benefits of the crime outweigh the costs of getting caught*
- *From the communities perspective:*
 - Perceived risk of getting caught – **must be high**
 - Punishment associated with getting caught – **perceived as severe**

Deterrence theory and RBTs

- Is based on one's decision-making processes – *does the benefits of the crime outweigh the costs of getting caught*
- *From the communities perspective:*
 - Perceived risk of getting caught – **must be high**
 - Punishment associated with getting caught – **perceived as severe**
- *From the procedural justice perspective:*
 - RBTs must be highly visible
 - Unpredictable
 - Difficult to evade
 - Range of consequences
 - Considered a 'high' threat by community

**Anywhere,
Anytime**

Estimated Costs of RBTs

- 12 million RBTs in Australia each year
- Total annual cost of police doing RBTs in Australia = \$71 million
- Cost of police doing ONE RBT = \$5.92
- Average length of ONE RBT = 20 seconds per encounter

Estimates are from Papafotiou-Owens & Boorman (2011) and Vos, Carter, & Barendregt (2010)

The estimated cost of MV accidents

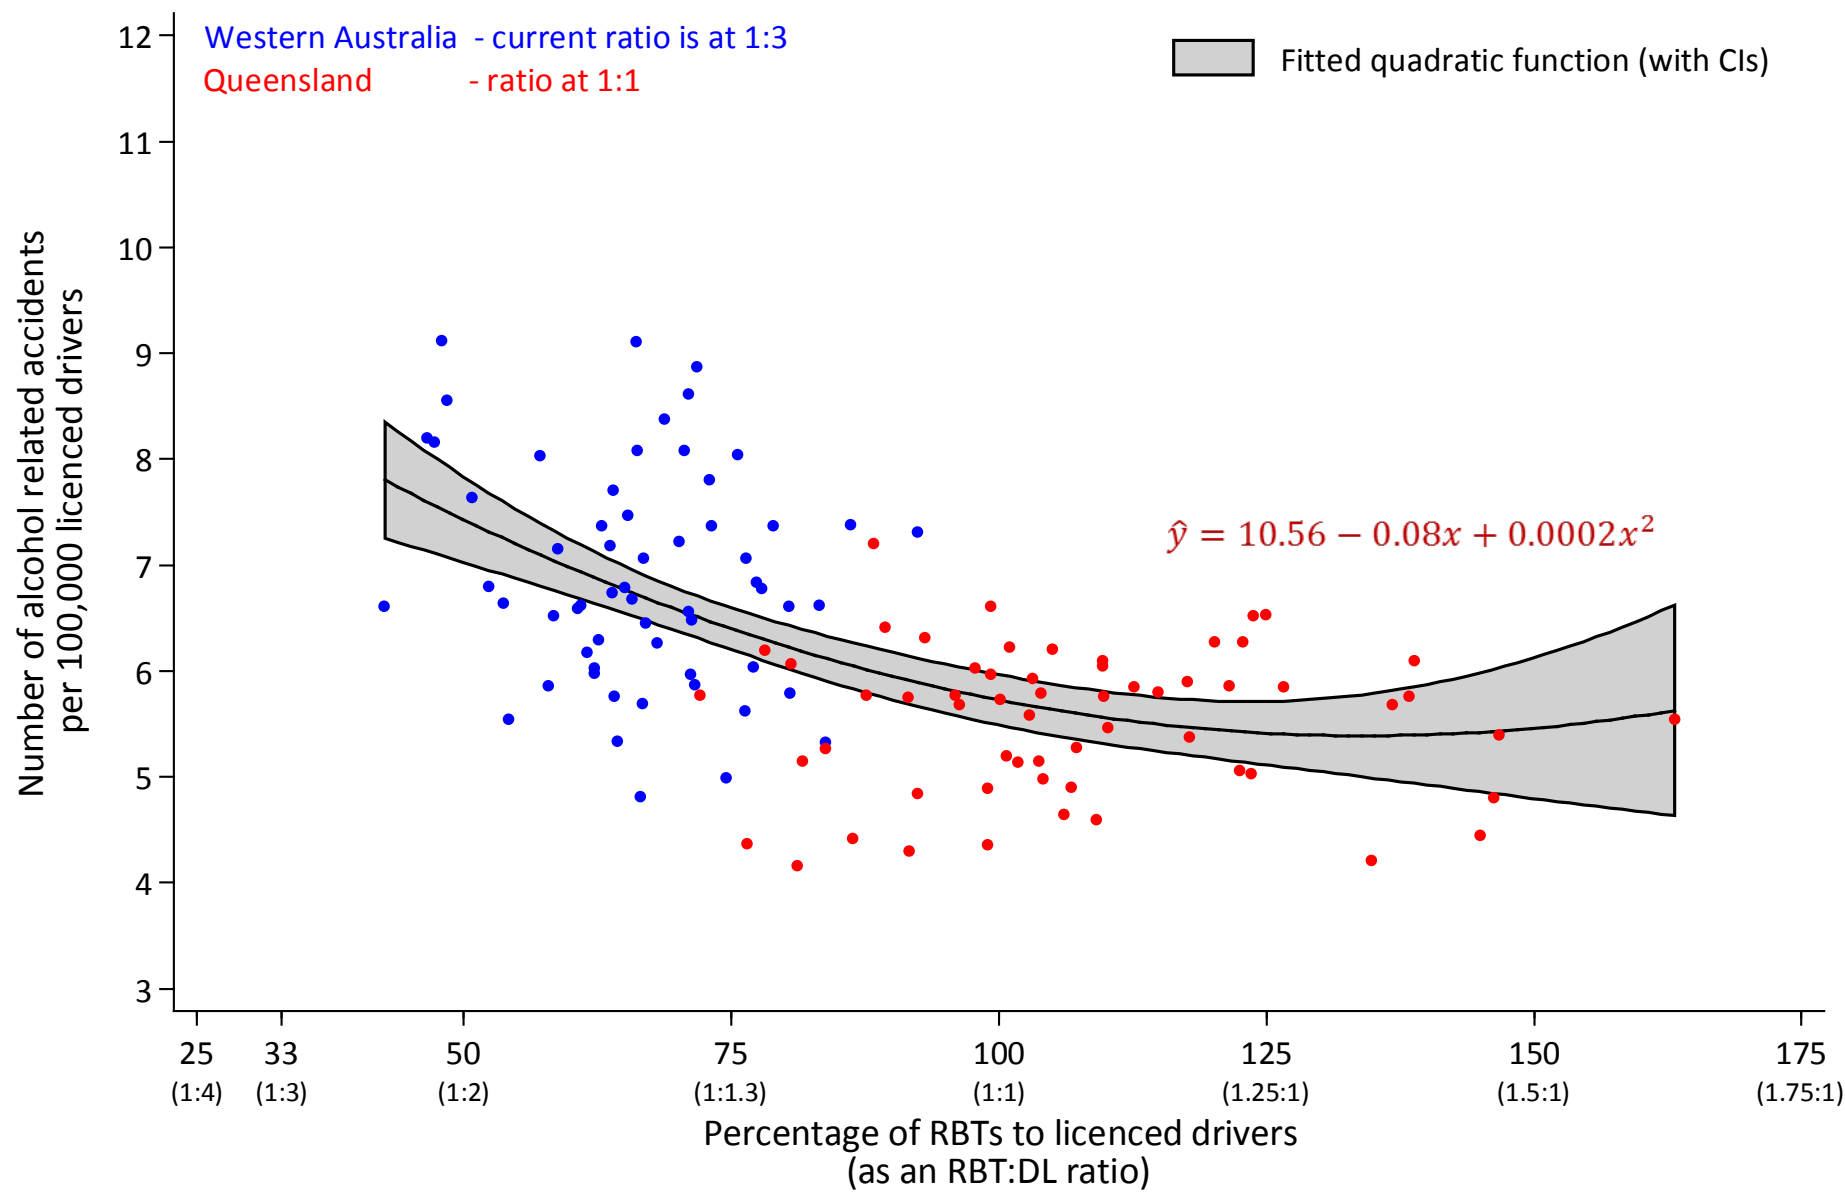

- Estimated cost of ONE fatal crash is \$2.67 million
- The cost of a hospitalised injury crash is about \$266,000
- The cost of a non-hospitalised injury crash is about \$14,700
- The average cost of a property damage-only crash is about \$9,950

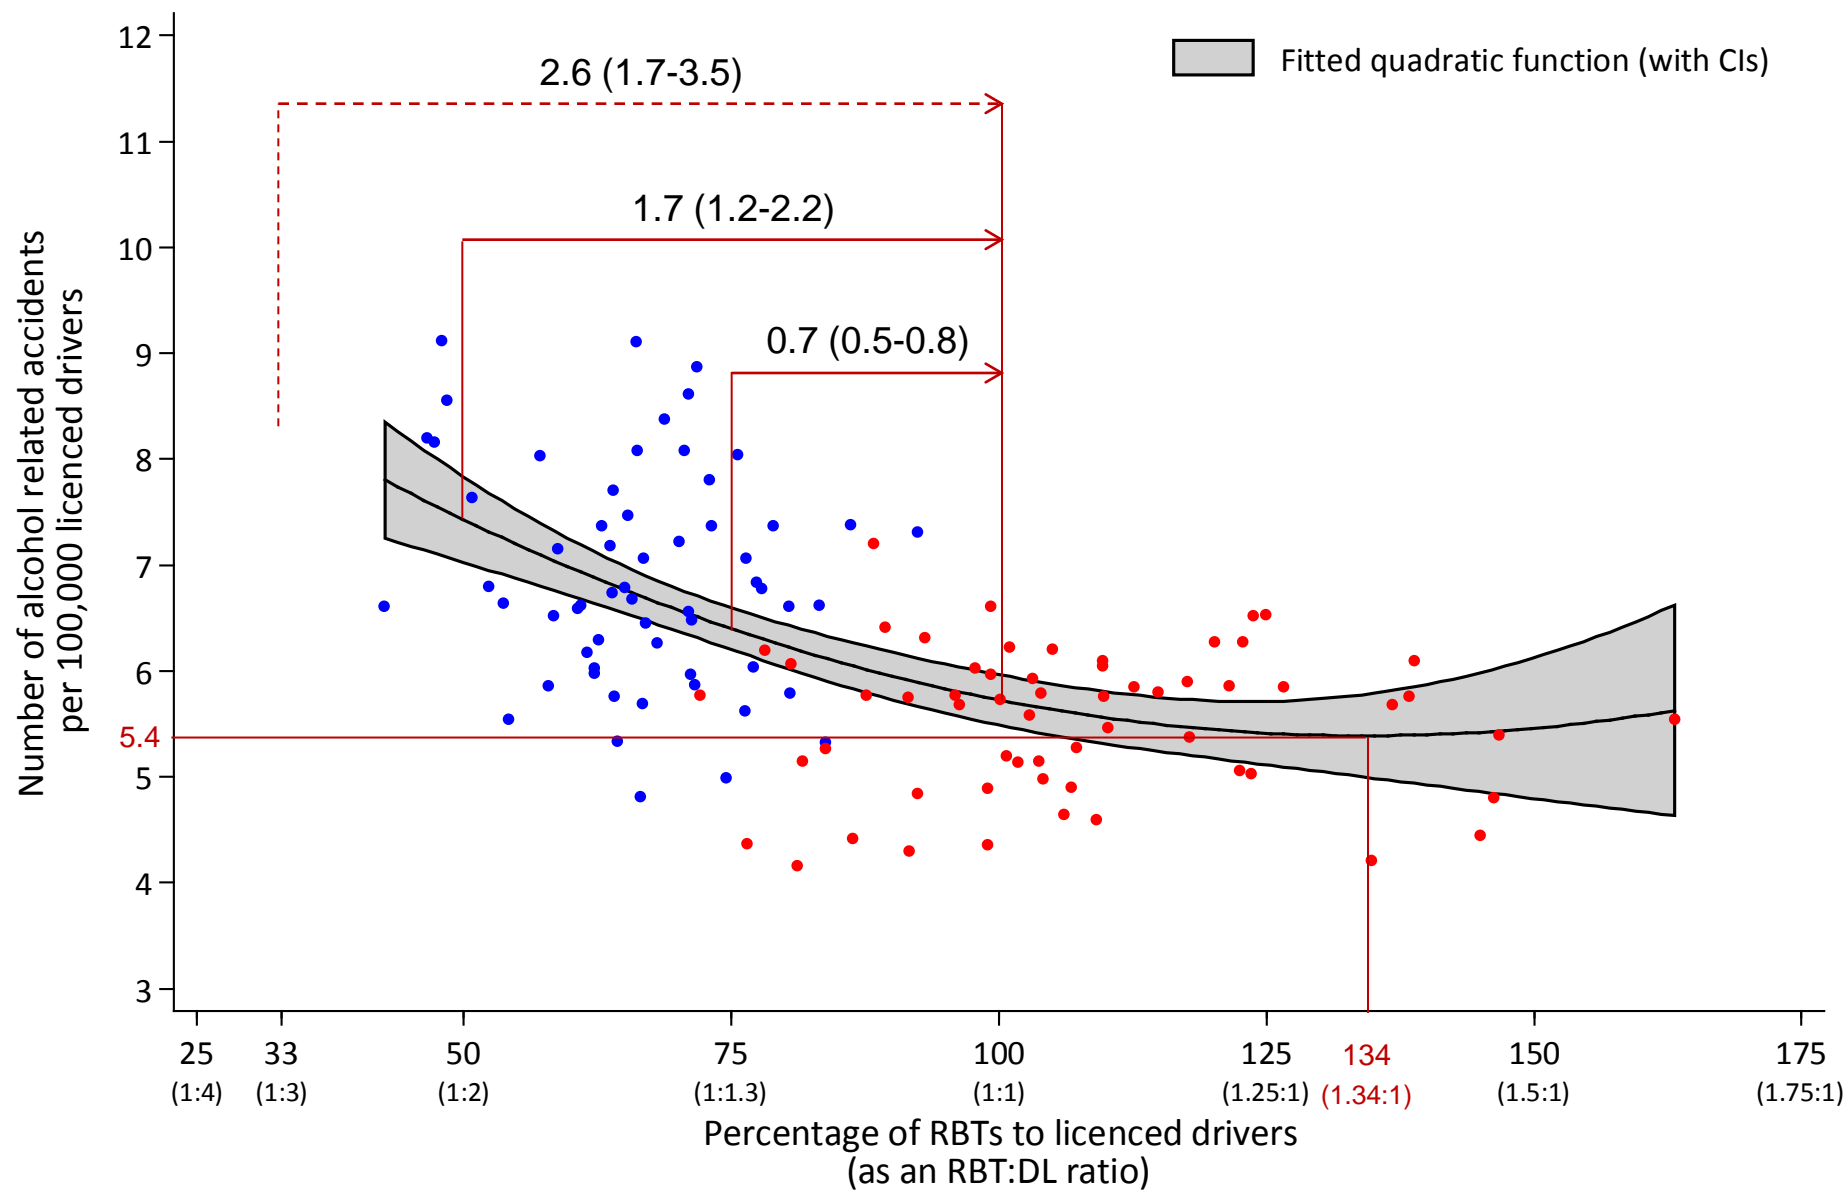

Preliminary findings based
on initial data from two states – QLD and WA
(2004-2009)

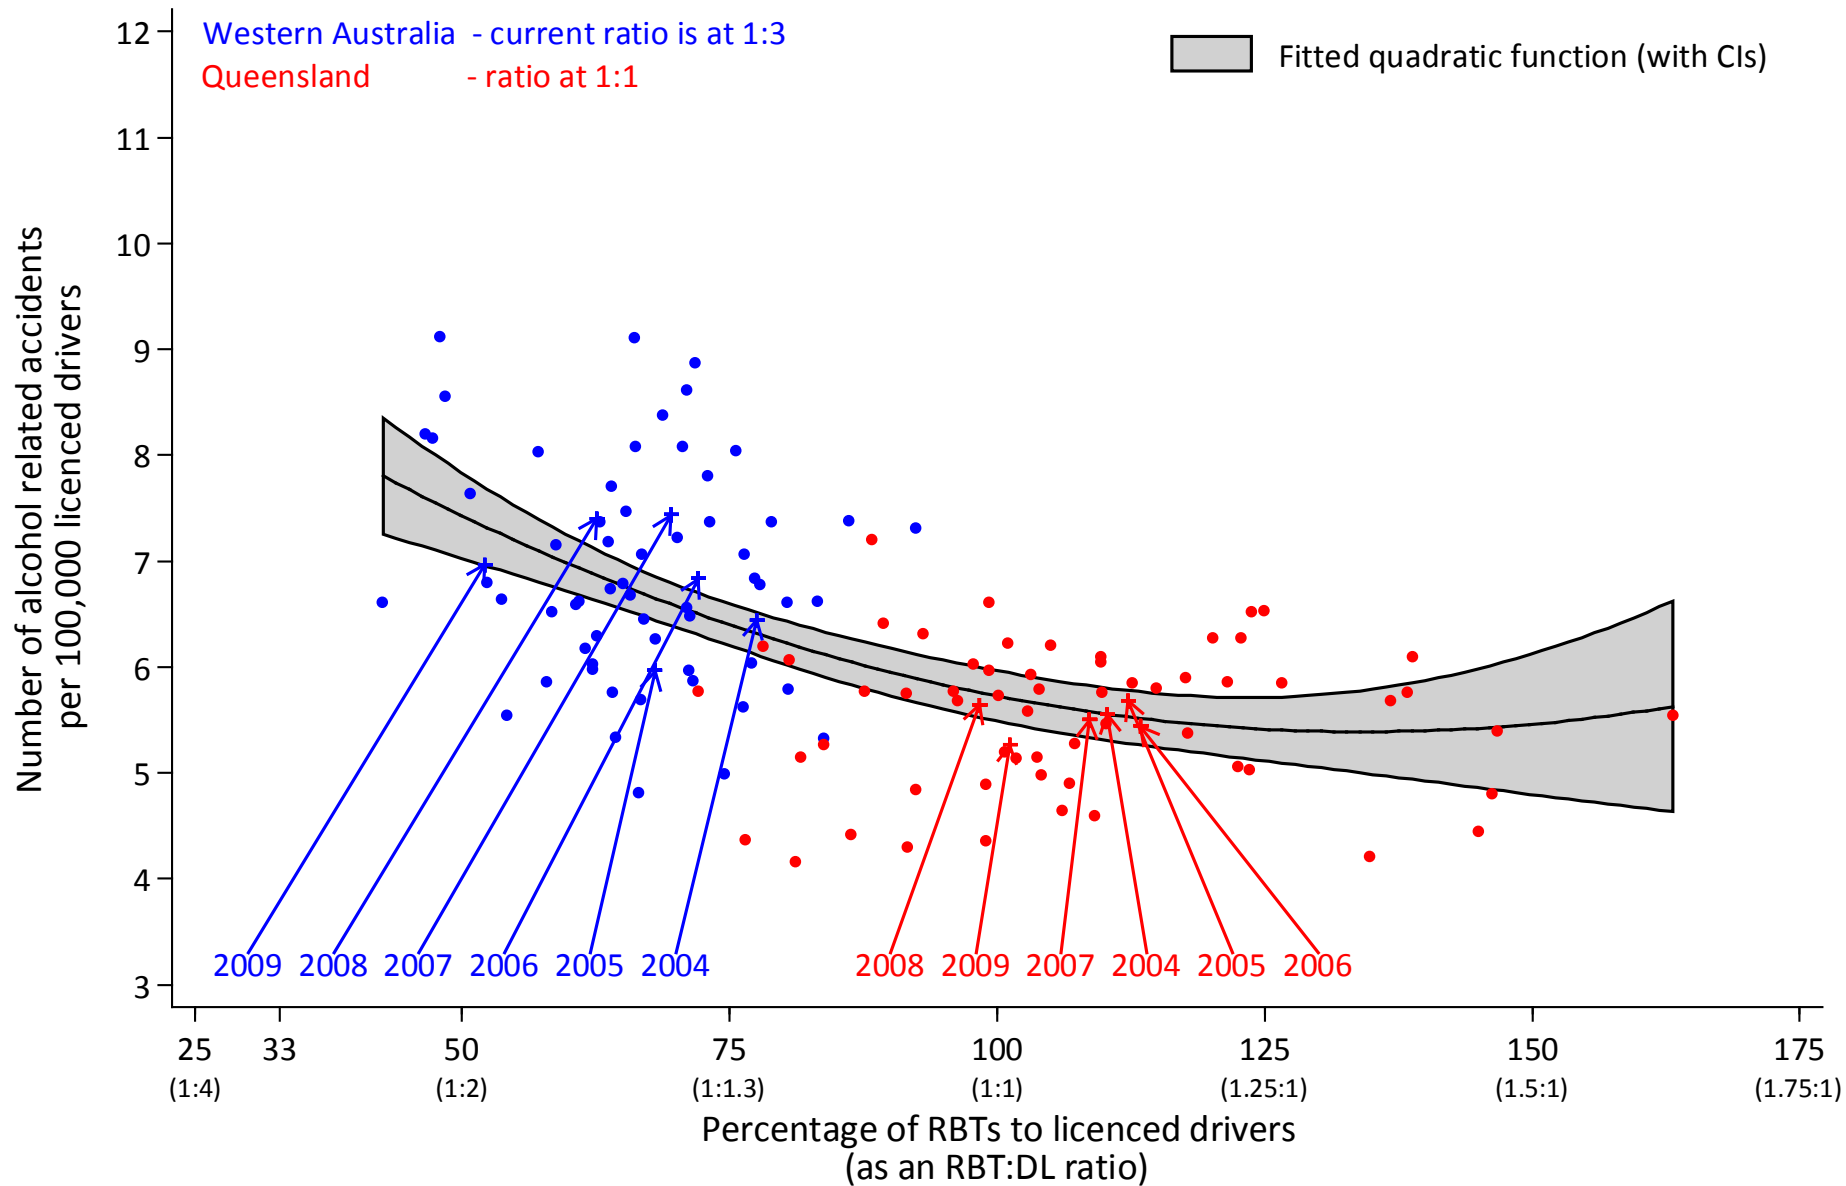

WA vs QLD

	WA	QLD
RBT : licensed driver ratio	1:3*	1:1
Population	2.3m	4.5m
State (population)	4 th	3 rd
Capital city (population)	75%	46%
Geographical size	2.5m km ²	1.8m km ²
Proportion urban	71%	60%
Licensed drivers	69%	71%
Current drinkers*	84%	83%
Drink-driving last 12 months	14%	9%
Odds Ratio of drivers admitting DUI p.a.	1.57	1

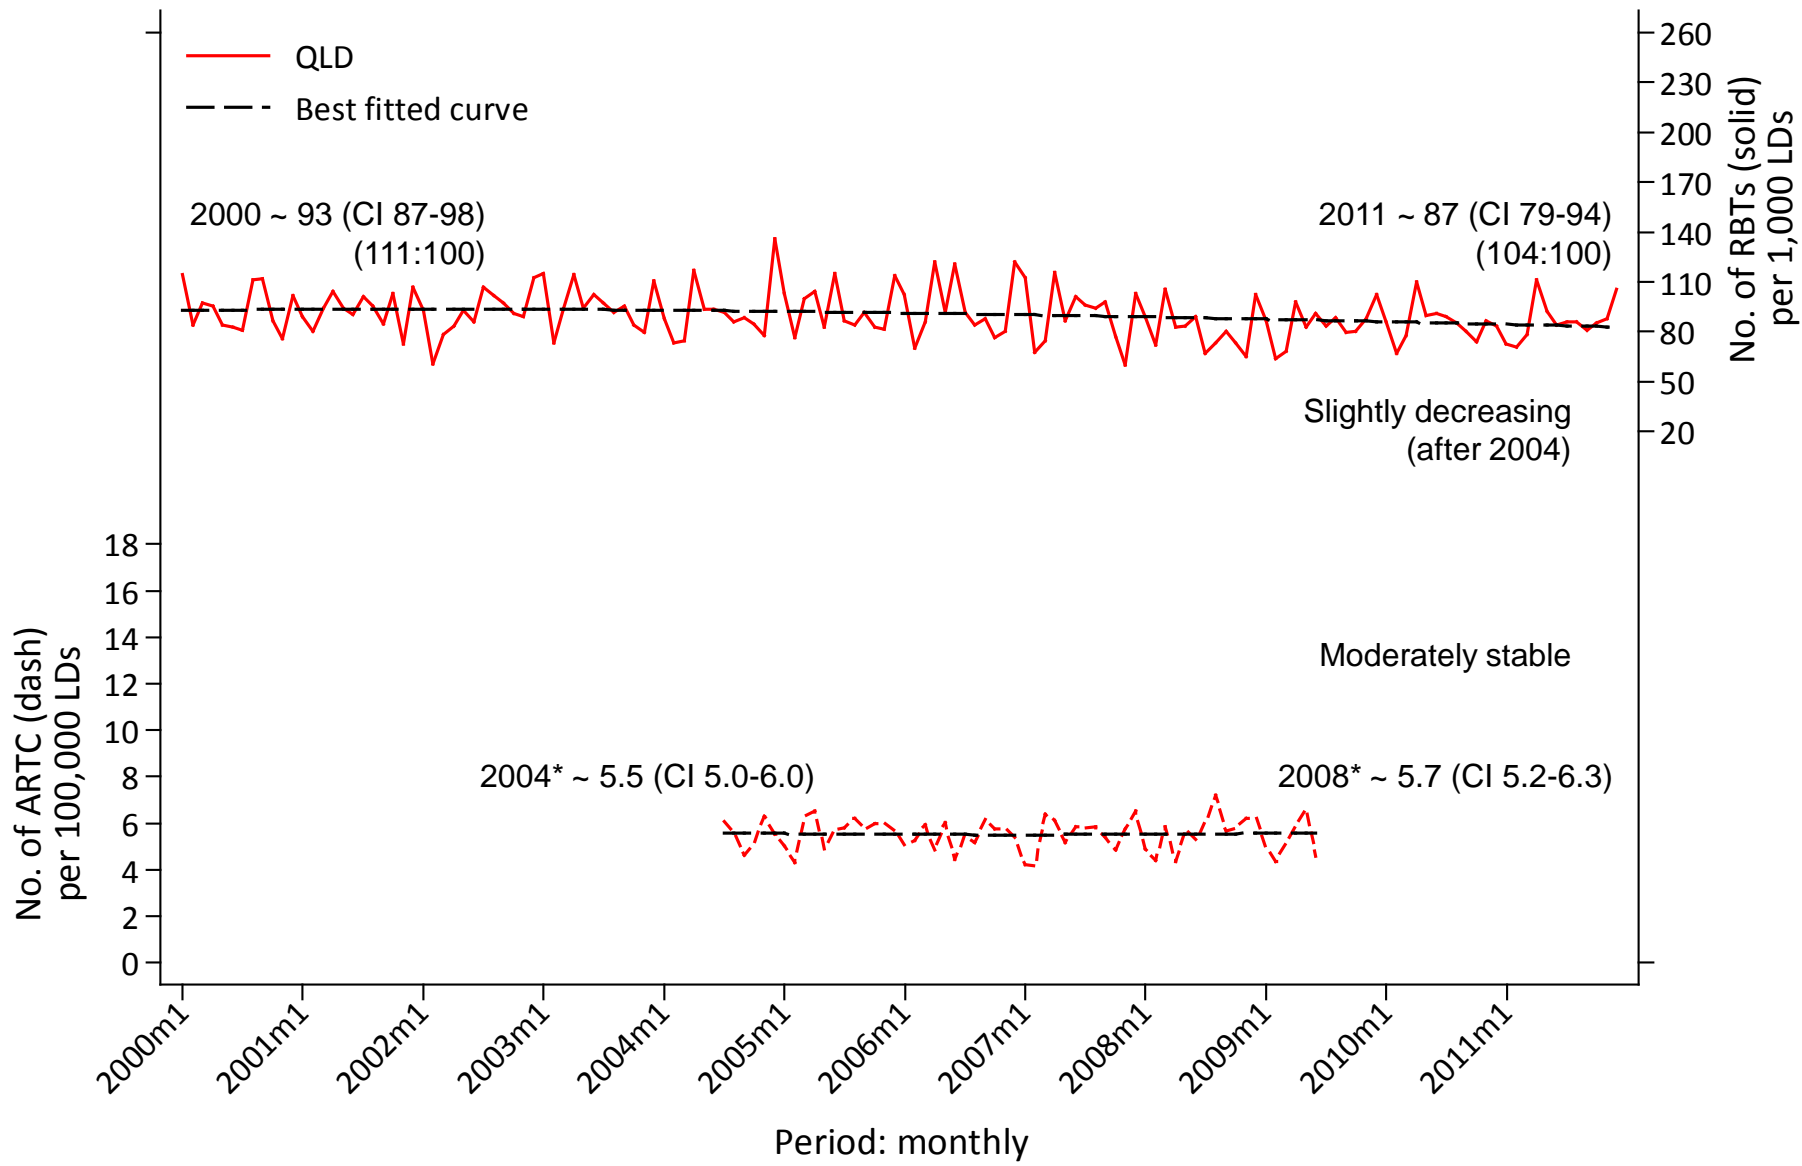

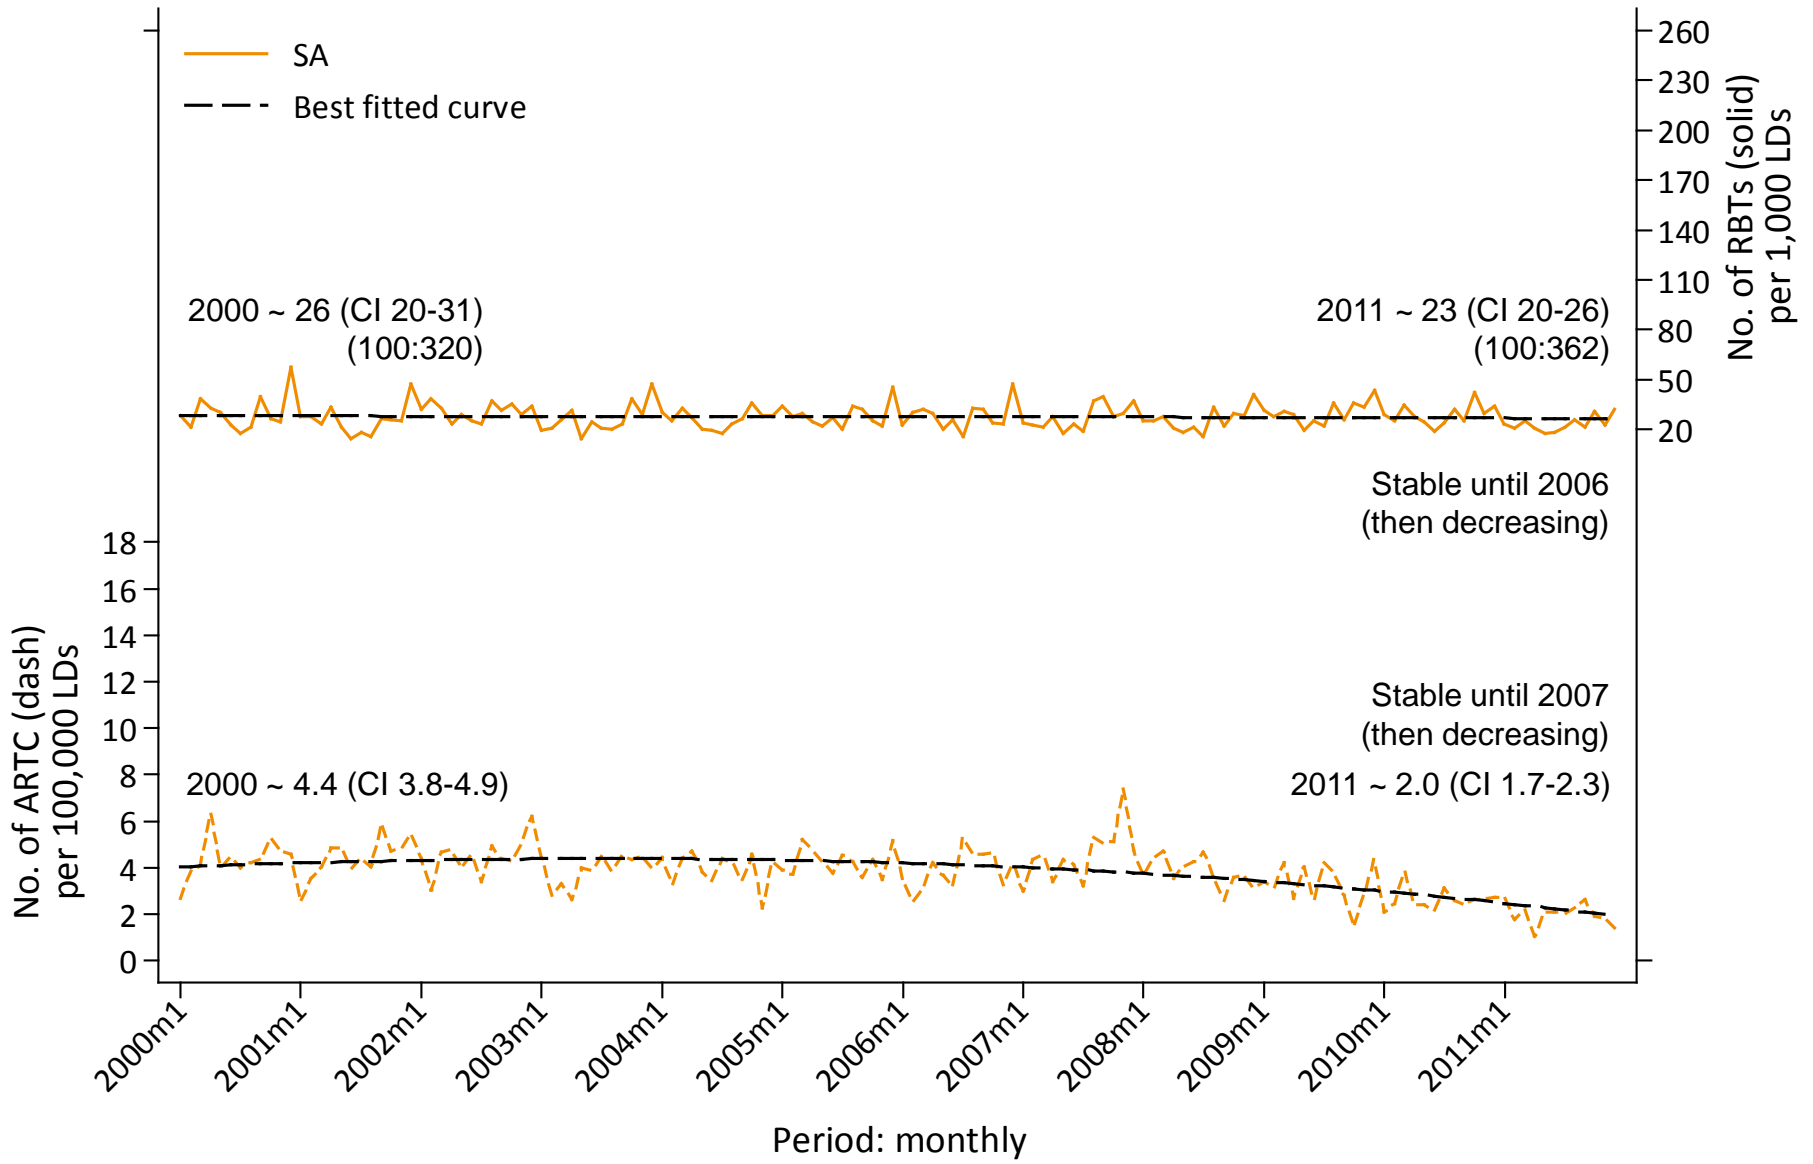

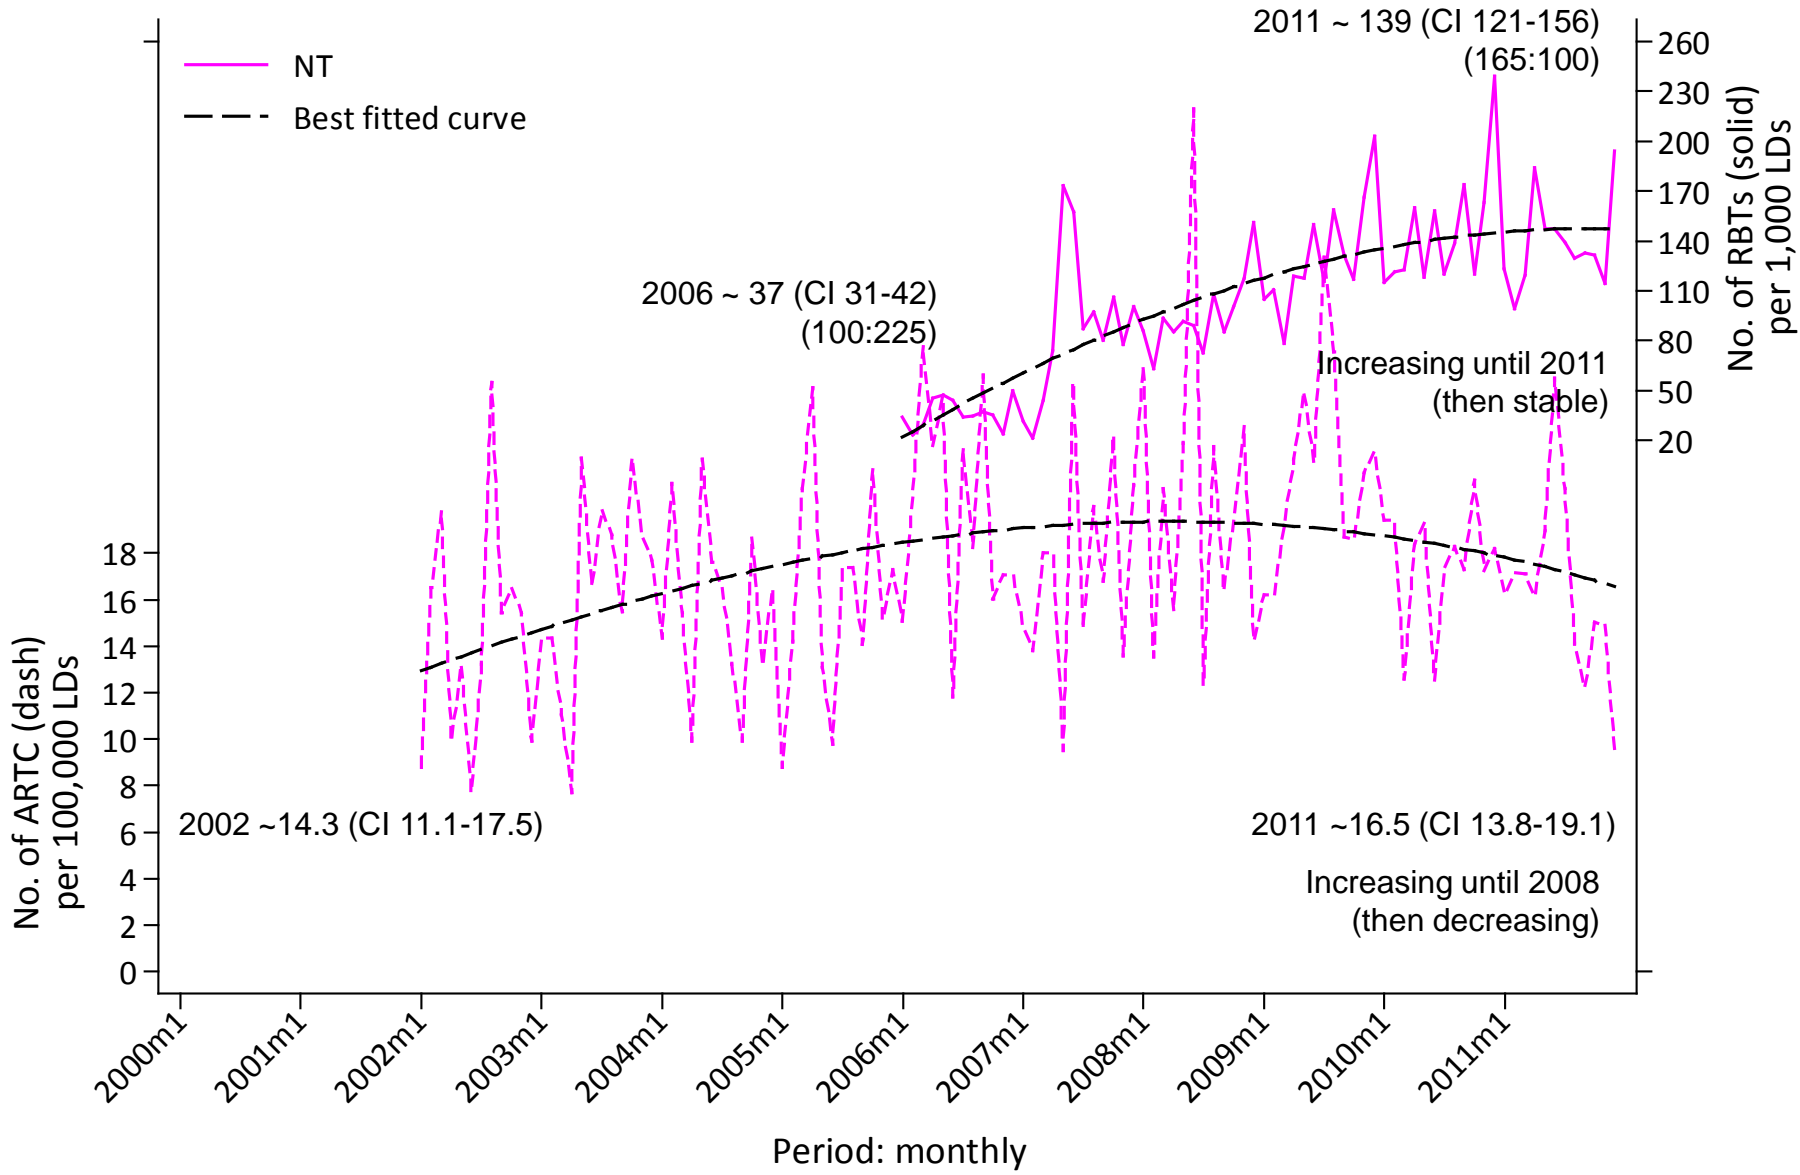

New data
Adding in more states
(2000-2011)

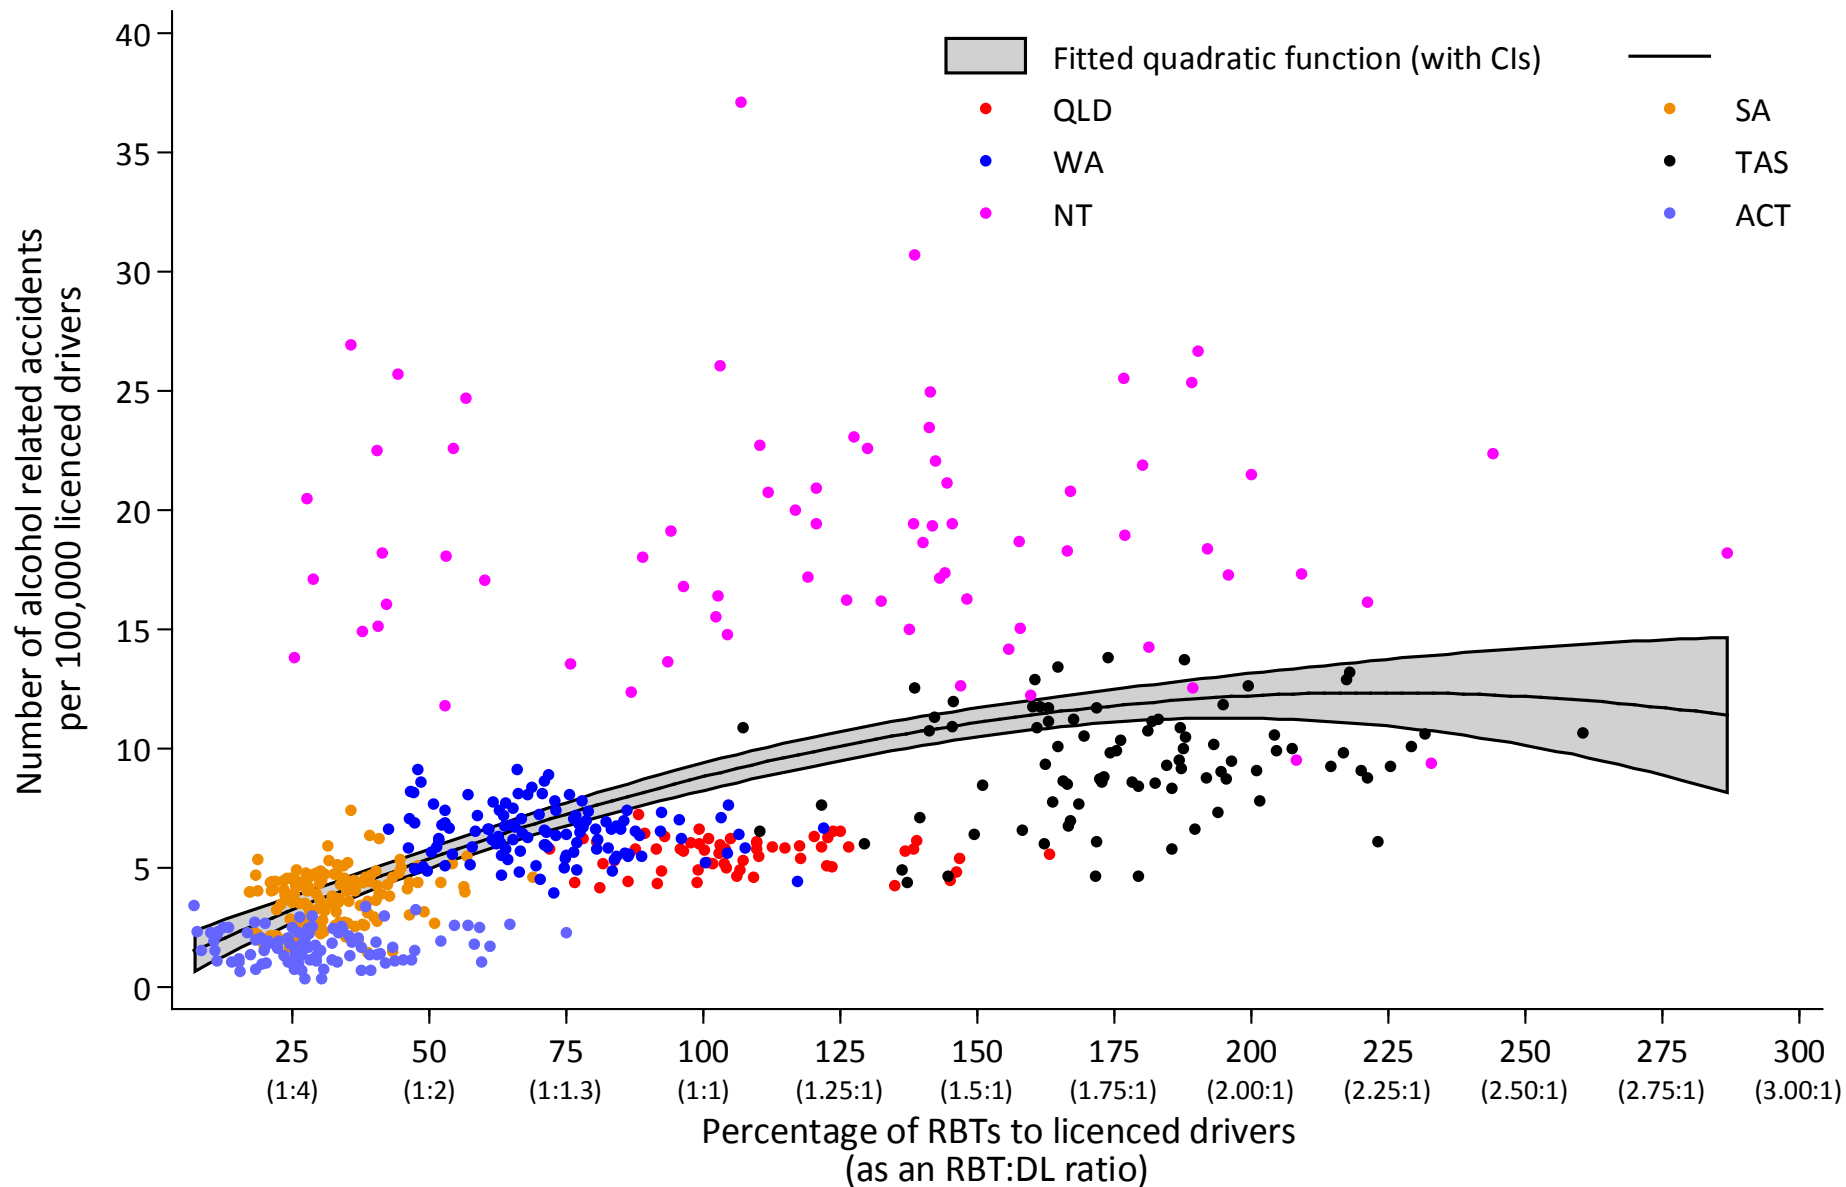

Summary of 6 States - Monthly

State	Period	RBTs:LD	Period	ARTC:LD	Comment
QLD	2000-11	Stable (↓)	2004*-09*	Stable	
WA	2000-11	Large ↓	2001-10	Large ↑	ARTC ↓ '09-'11
SA	2000-11	Stable (↓)	2000-11	↓	ARTC ↓ '07-'11
TAS	2004*-11	Unstable ↑↓	2005*-11	Unstable↑↓	Pattern of ARTC follows RBT
NT	2006-11	Large ↑	2002-11	Unstable↑↓	Since ↑ in RBTs substantial ↓ in ARTC
ACT	2004*-11	Stable ↓	2000-11	Stable (↓)	RBTs ↓ after 2006; Crashes ↓ after 2003
NSW	No monthly crash data				
VIC	No monthly RBT data				

Putting all the data together (2000-2011)

One size (does not) fit all

WA vs QLD

	QLD	WA	SA	TAS	NT	ACT
RBT : licensed driver ratio	1:1	1:3*	1:2	1.4:1	1:1	1:3
Population	4.5m	2.3m	1.6m	.5m	.2m	.4m
Rank (population)	3 rd	4 th	5 th	6 th	8 th	7 th
% in capital city (population)	46	75	75	42	50	99
Geographical size (km ²)	1.8m	2.5m	1.0m	0.07m	1.3m	.23m
Rank (size)	2 nd	1 st	4 th	7 th	3 rd	8 th
% licensed drivers	71	69	71	73	49	80*
% Current drinkers*	83	83	81	86	86	86
% Drink-driving last 12 months	9	14	13	12	15	15
Odds Ratio of drivers admitting DUI p.a.	1:00	1.57*	1.46*	1.40*	1.66*	1.71*

Variations by state

- Geographical factors
 - Urban density
 - Kilometers and spread of sealed road
 - Proportion living in capital cities
- Operational factors
 - RBT types
 - Stationary/Booze bus
 - Roving/Mobile
 - RBT targets
 - Numbers of RBTs conducted
 - Number of positive detections
 - Operational differences between city, regional, remote

Limitations and what next?

- Changes in recording of alcohol involvement at traffic accidents
- Administrative police data have '0%' BAC measures
 - These measures may represent – 'no' measure taken – not a zero
- Other limitation???

- We are currently modelling these data using crashes during high-alcohol hours as a proxy for alcohol related traffic crashes.
- We are looking into how the proportion of RBT types conducted impact the relationship between ARTC and RBTs

The following slides – I may not use – but they are about estimating the cost of RBTs and the effect of changing the RBT ratio – based on QLD and WA data

What does this all mean?

If we only use the WA and QLD data!

- The cost per RBT is \$6.00
- In WA, doubling the ratio of RBTs LD means increasing the monthly average number of RBTs from 60,000 to 120,000: an extra 60,000 RBTs/month
- This equates to $\$6 * 60000 * 12 = \4.5 million dollars p.a.
- Doubling the number of RBTs from 1:2 to 1:1 *may* result in ARTC reduction of 1.7 (1.2-2.2) per 100,000 LDs per month
- WA – 1,456,480 – therefore $1.7 * 14 = 23$ ARTC per month
- ~ if 1 in 10 ARTC result in fatality – 2.3 lives per month
- \$2.6 mill (cost per life) * 2.3 lives saved = is \$5.9 million saved per month
