## LANDINGS SUMMARY

### 1. The Pelagic Fishery (Kapenta)

Basin	1995	1996
Sanyati	7713	8183
Bumi / Chalala	3568	3516
Sengwa	1825	1839
Binga & Mlibizi	2174	1885
<b>Total</b>	<b>15280</b>	<b>15423</b>

### 2. The Inshore Fishery

Area	Catch in tonnes	
	1995	1996
C1	50.65	36.85
C2	114.20	88.20
C3	8.60	17.71
C4	157.34	116.54
C5	92.13	69.47
C6	combined with C7	
C7	29.55	<i>not recorded</i>
Total enumerated	393.20	289.34
<b>Total estimate</b>	<b>1 175</b>	<b>957.89</b>

**Grand total for Zimbabwe**

15 423 (Kapenta) + 957.89 (inshore) + 6.40 (tigerfish bycatch) = **16 387.29** tonnes

## *THE PELAGIC (KAPENTA) FISHERY*

## **Introduction**

This section of the report covers Kapenta catch records from the Zimbabwean part of Lake Kariba. Data are compiled from returns which the Kapenta fishing companies submit to Lake Kariba Fisheries Research Institute every month. Tiger fish landings are not accurate because the fishermen rarely submit all their catches to their employers. However, the recorded landings give a general trend.

Kapenta usually constitute about 90% of the total catch from Lake Kariba. However, within the last few years there has been a substantial increase in the incidence of theft and illegal sales from rigs. The scale of such illegal activities is difficult to quantify but we estimate that at least 20% of the total Kapenta catch is illegally sold before landing and thus not recorded. The figures of the Kapenta landings presented in the report must therefore be viewed as an underestimate of the total catch.

Kapenta fishing operations are based at 11 sites (Figure 1b). Of the 306 rigs registered to 73 companies in 1996, returns were received from 279 rigs which are assumed to have been operating. For statistical purposes, catches are recorded for the 5 hydrological basins namely Mlibizi, Binga, Sengwa, Bumi and Kariba (also known as Sanyati). The catches from Binga and Mlibizi are combined as the operators in these regions share common fishing grounds. Bumi and Chalala also use the same fishing grounds.

Operators are restricted to fishing in areas where water depth is greater than 20 metres and 3 km from developed areas along the shoreline. Fishing is not allowed in Leisure Bay, Charara Bay, Masango Bay, Gache Gache Bay and also in river mouths (Figure 1a).

There is a need for Kapenta operators to step up control and management of their employees in order to limit the scale of illegal sales and theft from rigs. Since the Kapenta operators, are fully responsible for their employees, they should consider coming together to form an independent Kapenta guard unit which operates at night to prevent thefts. The Department of National Parks and Wildlife Management could provide assistance to such a unit.

## *THE INSHORE FISHERY*

## **Sampling in the Inshore Fishery**

The sampling system in use has been designed to provide a statistically valid catch estimation for the whole of the Zimbabwe inshore fishery on Lake Kariba. Whereas the Kapenta data represent total actual landed catches, data from the artisanal fishery are from sampled catches. Thus all figures presented for the artisanal fishery are estimates. The exceptions are the data from Nyaodza , Gache Gache and Luyando co-operatives which submit returns for the whole year reflecting the actual total landings. The fishing areas are divided into 7 zones, C1 to C7 (Figure 7) thus all areas and all basins are represented. The fishing activities are simplified because there is only one type of gear (gill-nets) used throughout the whole inshore fishery of Zimbabwe.

The Kapenta, which occupy the open pelagic waters of the lake represent a unit stock which is harvested by both Zimbabwe and Zambia; whereas the artisanal fishery exploits inshore species which, in general , occupy water less than 10m deep along the shoreline. The Zambian and Zimbabwean inshore fisheries may therefore be considered to be exploiting two separate stocks. The inshore fishery of Zambia therefore has no influence upon the inshore fishery of Zimbabwe and vice versa.

As it is not possible to sample all villages nor the total landings for any particular village for the whole year, 10 representative villages are enumerated for 10 days every month. The sampled catch is raised to an estimate of the total catch per village by multiplying by the ratio between total number of days sampled and days in the year. To estimate the total catch for the Zimbabwean side of the lake, the ratio between the number of fishermen in the villages sampled and the total number of fishermen on the Zimbabwean side of the lake is used.

The above calculations make the assumption that fishing takes place on 360 days and that the catchability of the species is the same throughout the whole lake. It is also assumed that the number of active fishermen per village is approximately the same throughout the year.

National Parks regulations state that each fisherman is allowed a maximum of 5 gill-nets with a minimum mesh size of 100mm, and conformation to this regulation is assumed for catch effort calculations.

The main species in the inshore fishery are the breams *Oreochromis mortimeri*, *Sargochromis codringtonii*, *Tilapia rendalli*; the cyprinid *Labeo altivelis*; the tigerfish *Hydrocynus vittatus*; the mormyrid *Mormyrus longirostris*; the barbel *Clarias gariepinus* and the squeaker *Synodontis zambezensis*.

Figure 7 : Location of Artisanal fishing villages on Lake Kariba

TOTAL			73.25	1 517 085	4.8	378	670	289.34
								6 132 383

The actual total catch for co-op returns in area C1 & C3 is 72.26t and estimated total catch for enumerated villages is 289.34 tonnes. The total estimate for the whole lake is  $289.34 \times \frac{\text{Total fishermen for the whole lake} + (\text{co-op Catches})}{\text{Number of fishermen in the above villages}} = 289.34 \times \frac{1157}{378} + 72.26 = 957.89t$
