Performance-Based Optimization of Structures Theory and Applications

Dr Qing Quan Liang

Table of Contents

Preface
Acknowledgements
Notations

Chapter 1 Introduction
1.1 Background
1.2 Types of Structural Optimization
1.3 Performance-Based Design
1.3.1 Design concepts and criteria
1.3.2 The overall performance-based design process
1.4 General Formulation of Optimization Problems
1.5 The Finite Element Method
1.6 References

Chapter 2 PBO for Fully Stressed Topology Design
2.1 Introduction
2.2 Performance Objective for Structures with Stress Constraints
2.3 Element Removal Criteria Based on Stress Level
2.4 Element Elimination Techniques
2.5 Stress-Based Performance Indices
2.6 Performance-Based Optimality Criteria
2.7 Performance Characteristics of Structures with Stress Constraints
2.8 Performance Optimization Procedure
2.9 Element Addition and Deletion Schemes
2.9.1 Element addition and deletion criteria
2.9.2 Optimization algorithm
2.10 Cavity Controls in Topology Optimization
2.10.1 Concepts of cavity controls
2.10.2 Cavity control algorithm
2.11 Examples
2.11.1 Two-bar frame structure
2.11.2 Michell-type structures with height constraints
2.11.3 Ranking the performance of structural topologies
2.12 Conclusion
2.13 References

Chapter 3 PBO for Structures with Displacement Constraints
3.1 Introduction
3.2 Performance Objective for Structures with Displacement Constraints
3.3 Element Removal Criteria Based on Virtual Strain Energy Density
3.4 Checkerboard Patterns
3.4.1 Causes of checkerboard patterns
3.4.2 Perimeter control method
3.4.3 The filtering technique
3.4.4 Density slop control method
3.4.5 Checkerboard suppression algorithm in PBO
3.5 Displacement-Based Performance Indices
3.5.1 Performance index for plane stress structures
3.5.2 Performance index for plates in bending
3.6 Performance-Based Optimality Criteria
3.7 Performance Characteristics of Structures with Displacement Constraints
3.8 Performance Optimization Procedure
3.9 Element Addition and Deletion Schemes
3.9.1 Element addition and deletion criteria
3.9.2 Optimization algorithm
3.10 Examples of Plane Stress Structures
3.10.1 Two-bar frame structure
3.10.2 Effects of geometry constraints
3.10.3 Multiple displacement constraints
3.10.4 Multiple load cases
3.10.5 Ranking the performance of structural topologies
3.11 Examples of Plates in Bending
3.11.1 Clamped plate under concentrated loading
3.11.2 Simply supported plate under area loading
3.11.3 Clamped plate under strip loading
3.12 Conclusion
3.13 References

Chapter 4 PBO for Structures with Mean Compliance Constraints
4.1 Introduction
4.2 Performance Objective for Structures with Mean Compliance Constraints
4.3 Element Removal Criteria Based on Strain Energy Density
4.4 Checkerboard Suppression Algorithm
4.5 Energy-Based Performance Indices
4.5.1 Performance index for plane stress structures
4.5.3 Performance index for plates in bending
4.6 Performance-Based Optimality Criteria
4.7 Performance Characteristics of Structures with Mean Compliance Constraints
4.8 Optimal Design for Multiple Load Cases

4.8.1 Optimization problem formulation
4.8.2 Two level control scheme
4.9 Performance Optimization Procedure
4.10 Element Addition and Deletion Schemes
4.10.1 Element addition and deletion criteria
4.10.2 Optimization algorithm
4.11 Sizing Optimization of Continuum Structures
4.11.1 Thickness design problem formulation
4.11.2 Element thickness reduction criteria
4.11.3 Performance-based sizing optimization algorithm
4.12 Integrated Topology, Shape and Sizing Optimization
4.13 Examples
4.13.1 Michell structure
4.13.2 Form optimization of bridge structures
4.13.3 Multiple load cases
4.13.4 Optimal shape design
4.13.5 Plates in bending
4.13.6 Effects of finite element meshes
4.14 Conclusion
4.15 References

Chapter 5 Automatic Generation of Strut-and-Tie Models in Structural Concrete
5.1 Introduction
5.2 Historical Development of Strut-and-Tie Model Approach
5.3 Traditional Methods for Developing Strut-and-Tie Models
5.4 Key Features of Strut-and-Tie Models
5.5 B-Regions and D-Regions in Concrete Structures
5.6 Strut-and-Tie Modeling as A Topology Optimization Problem
5.7 Limit Analysis and Finite Element Modeling
5.8 Optimization Criteria for Strut-and-Tie Models
5.8.1 Element removal criteria
5.8.2 Performance-based optimality criteria
5.9 Design Optimization Procedure
5.10 Dimensioning Struts, Ties and Nodal Zones
5.10.1 Strength performance requirement
5.10.2 Concrete struts
5.10.3 Ties
5.10.4 Nodal zones
5.11 Multiple Load Cases
5.12 Optimal Strut-and-Tie Models in Reinforced Concrete
5.12.1 Verification by experimental evidences
5.12.1.1 Verification I
5.12.1.2 Verification II
5.12.2 Deep beam with a large hole

5.12.3 Effects of span-to-depth ratios
5.12.4 Continuous deep beams
5.12.5 Corbels
5.12.5.1 Corbel mounted on a column
5.12.5.2 Corbel with a ledge support
5.12.5.3 Corbel mounted on the top of a column
5.12.6 Bridge pier
5.12.7 Shearwall with openings
5.12.8 Beam-column connections
5.12.8.1 Opening knee joints
5.12.8.2 Closing knee joints
5.12.8.3 Exterior beam-column connections
5.12.8.4 Interior beam-column connections
5.13 Optimal Strut-and-Tie Models in Prestressed Concrete
5.13.1 Nonprestressed concrete beam
5.13.2 Partially prestressed concrete beam
5.13.3 Fully prestressed concrete beam
5.14 Worked Design Examples
5.14.1 Deep beam under two point loads
5.14.2 Deep beam under one point load
5.14.3 Bridge pier
5.15 Conclusion
5.16 References

Chapter 6 Optimization of Lateral Load Resisting Systems
6.1 Introduction
6.2 Lateral Load Resisting Systems
6.2.1 Rigid frames
6.2.2 Semi-rigid frames
6.2.3 Braced frames
6.2.4 Framed tubes
6.2.5 Exterior braced tubes
6.2.6 Shearwalls
6.3 Steel-Concrete Composite Systems
6.3.1 Composite beams
6.3.1.1 Shear connection
6.3.1.2 Composite beams in combined bending and shear
6.3.1.3 Modeling of composite beams
6.3.2 Composite columns
6.4 Semi-Rigid Connections
6.5 Optimization of Bracing Systems
6.5.1 Optimization problem formulation
6.5.2 Element removal criteria
6.5.3 Performance-based optimality criteria

6.5.4 Design optimization procedure
6.6 Sizing Optimization of Lateral Load Resisting Systems
6.6.1 Sizing problem formulation
6.6.2 Member sizing criteria
6.6.3 Optimization algorithm
6.7 Illustrative Design Examples
6.7.1 Six-story steel frame
6.7.2 The 3-bay, 12-story steel frame
6.7.3 Effect of regions without bracing
6.7.4 The 4-bay, 12-story steel frame
6.7.5 The 4-bay frame with two bays braced
6.8 Conclusion
6.9 References
