In partial fulfilment of the award of:

Doctor of Business Administration,
Faculty of Business, University of Southern Queensland, Australia

2012

Abstract

This dissertation describes a proposed framework of knowledge, skills, abilities, and other characteristics (KSAOs) of a practitioner who is competent in business ethics, compliance, or integrity should possess. These competencies may be leveraged as key input to selecting content for an institutionalized business ethics (BE) training program.

The research problem for this dissertation was: *What competencies are important for job performance of business ethics practitioners in industry and how do their perceptions compare with those of academics?*

Triangulation of research methods and data sources—including industry (public service and private sector) and academics, were used to investigate this problem. Phase I consisted of developing a *provisional taxonomy of business ethics competencies* through the use of the secondary methodology to help design a survey questionnaire.

Phase II involved a survey of academic and industry practitioners implicated in business ethics to empirically validate the conceptually developed *provisional taxonomy of business ethics competencies* and help identify potentially under or over-emphasized competencies to help make recommendations regarding the selection of business ethics training content by choosing relevant course materials based on competencies and key risks and issues.

Several theoretical and pragmatic contributions to the business ethics training, competency-based management, and risk management bodies of knowledge are made that include:

Institutionalized BE Program (IBEP) parent theory and body of knowledge

A *model for content selection for BE instruction* is developed to help guide future selection and tailoring of training content based on baseline competencies and organizational context.

Competency-Based Management (CBM) parent theory and body of knowledge

A conceptually and empirically developed and content validated *proposed business ethics competency model* that may serve to guide future research in this neglected area is provided.

Risk Management (RM) parent theory and body of knowledge

Given the rapid pace of technological, social, economic, and other constant changes faced by organizations, future competency identification is made possible by the proposed enhancement of traditional environmental scanning methods to include new dimensions to the risk identification process through the creation of an *extended environmental scanning model (STEEP LEDGES)*. Also, the traditional risk assessment framework is enhanced by adding prevalence, a third dimension to augment likelihood and impact that should help assess current and new risks and issues using the *extended risk assessment model (LIP)*.

Keywords: Business ethics, business ethics competencies, KSAOs, competency-based management, business ethics competency model, business ethics competency taxonomy, risk management, risk assessment, risk identification, environmental scanning, institutionalized ethics program, organizational ethics program, ethics training and development, ethics typology, risk assessment typology.

Certification of Dissertation

I certify that the ideas, experimental work, results, analysis, software, and conclusions reported in this dissertation are entirely my own effort, except where otherwise acknowledged. I also certify that the work is original and has not been previously submitted for any other award, except where otherwise acknowledged.

ENDORSEMENT

Prof. Ronel Erwee
Research Advisor & Principal Supervisor

Date

'Always fight for progress and reform. Never tolerate injustice or corruption; always fight demagogues of all parties — never lack sympathy for the poor; always remain devoted to the public welfare; never be satisfied with merely printing the news; always be drastically independent; never be afraid to attack wrong.'

— Joseph Pulitzer, media mogul (1847-1911)

Acknowledgements

I wish to thank my wife Josée and her family for their support and encouragement; and to my wife in particular, for her continued understanding and caring in all matters.

To my parents, Gaby and Roger, whom I love dearly.

I am blessed and eternally grateful for my precious and faithful Candy, my little angel, ever patient, determined, and cheerful; and to my other angel Coco for her love. Both are a Godsend.

Finally, I wish to thank the University of Southern Queensland for obliging me this opportunity, in particular my supervisor Professor Ronel Erwee, the previous Head, School of Management and Marketing, Professor Doren Chadee, and my Associate supervisor Ben Swanepoel for their continued support and professional guidance, without which I would not have been able to continue with this personal endeavour and passion.

A heartfelt thanks to all!

I dedicate this work in memory of my cousin Vincent who led a short but exemplary life—one which touched many profoundly. Vincent was a true champion for good, and a kind soul. I also dedicate this work in memory of uncle Gilles who helped bind the family together and will always be in our hearts as well as many family relatives and friends now departed—each had an influence on my life.

List of Key Definitions

The business ethics literature reveals a lack of consensus on key terms (Sims 2002) and a lack of explicit definitions in past research (Hosmer 1996). Key or potentially controversial terms for this study are defined below to provide clarity and establish a position.

Academia – business ethics academics and those in related disciplines (e.g., moral philosophy, theology, business law, or management) who teach business ethics content.

Business ethics academic – a university or college professor who teaches business ethics content (e.g., theory, cases, issues) either as part of a stand-alone ethics course or integrated into other business courses (e.g., finance, HRM, accounting).

Business ethics practitioner – an individual whose primary occupation is to provide advice and guidance to managers and employees on issues of values and ethics, integrity, and compliance as well as performing other duties related to values and ethics such as conducting investigations of alleged ethical wrongdoing or providing training on workplace ethics. Specific practitioner job titles may vary significantly (Murphy & Leet 2007).

Business ethics topic – any subject confronting an organization or its agents that could challenge an agent's sense of appropriateness, values or principles and could negatively or positively impact an organization's ability to deliver on its mandate or limit its ability to meet its objectives (PWGSC 2009b). Moral topics of a personal or societal nature or those belonging to applied ethics such as medicine and law do not constitute business ethics topics—e.g., assisted euthanasia, cloning or genetic manipulation.

Competency – A characteristic of an individual such as knowledge, skill, ability, or other (KSAO) attribute that underlies work performance or behaviour (Campion et al. 2011; Slivinski & Miles 1996).

Ethical issue – a significant occurrence of a known event or situation, certain to affect ethical decisions or behaviour if left unaddressed; differentiated from ethical risk by virtue of its certainty of occurrence. Also, an unresolved ethical problem or concern in question or dispute over which there are opposing views or disagreements.

Ethical risk – uncertainty, real or perceived, surrounding future events and outcomes that have the potential to influence ethical decisions or behaviour; consists of the likelihood of occurrence, impact, and prevalence; an uncertain occurrence, differentiated from an *ethical issue* by virtue of its lack of certainty. (PWGSC 2009b)

Progressive employment practices – a broad range of human resources (HR) practices aimed at workforce recruitment or retention including flexible work schedules, family-friendly work/life balance policies, coaching and mentoring programs, and so forth.

Remote absenteeism – an employee who is absent while purportedly being on the job remotely teleworking from home or another locale. This form of truancy to focus on personal pursuits could include employees who absent themselves while claiming to go to off-site meetings, courses, conferences or other fora who remain ‘connected’ to work via Information and Communications Technologies (ICT) such as a laptop or Blackberry to give the appearance of being on the job.

Taxonomy – the theory, principles, classification scheme and process that partitions a body of knowledge and defines the relationships among its pieces into a resulting hierarchical structure to facilitate understanding (Webster 1984; Radatz 1996). The process is the theoretical study of identification and empirical classification, including its principles, procedures and rules (Bailey 1994; Krippendorff 2004).

Virtual absenteeism – an employee who uses the Internet or a company’s Information and Communications Technologies (ICT) for personal pursuits during paid work hours (Friedman 2002). This could include employees spending an inordinate amount of work-related time to conduct personal business by arranging upcoming vacations, wedding, or appointments, conducting stock trades or online shopping, or simply browsing the Internet or being addicted to social media.
