ATTRACTION AND PASSAGE EFFICIENCY OF A VERTICAL-SLOT FISH PASS FOR SEA LAMPREY

Bernardo QUINTELLA, C.S. MATEUS, C.M.
ALEXANDRE, E. PEREIRA, A.F. BELO, R. OLIVEIRA,
P.R. ALMEIDA

**INTERNATIONAL CONFERENCE ON ENGINEERING
AND ECOHYDROLOGY FOR FISH PASSAGE**
JUNE 19-21, 2017 | Oregon State University Corvallis, Oregon (USA)

Outline

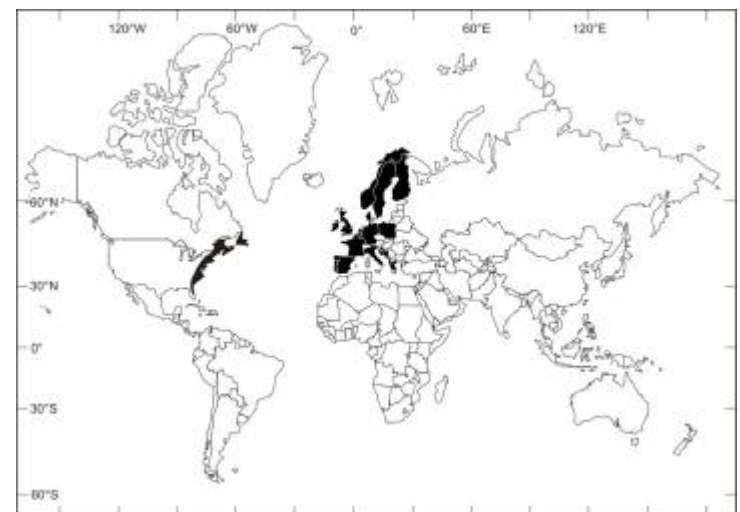

- Sea lamprey background
- Coimbra fishway (River Mondego)
- Attraction efficiency
 - Lamprey counts / statistical model
- Passage efficiency
 - PIT tagging
- Pre & post operational monitoring
- Conclusions

Sea lamprey background

- Anadromous species (1.2 m length; 2.3 kg weight)
- Worldwide distribution - both sides North Atlantic
- “Vulnerable” (Portuguese Red List, 2005)
- “Least concern” (Global IUCN Red List, 2014)
 - Pop. trend: stable

Socio-economic relevance

Gastronomy festivals

Cultural Heritage Lamprey Brotherhood

Threats - commercial fishing

FYKE net

Drift TRAMMEL net

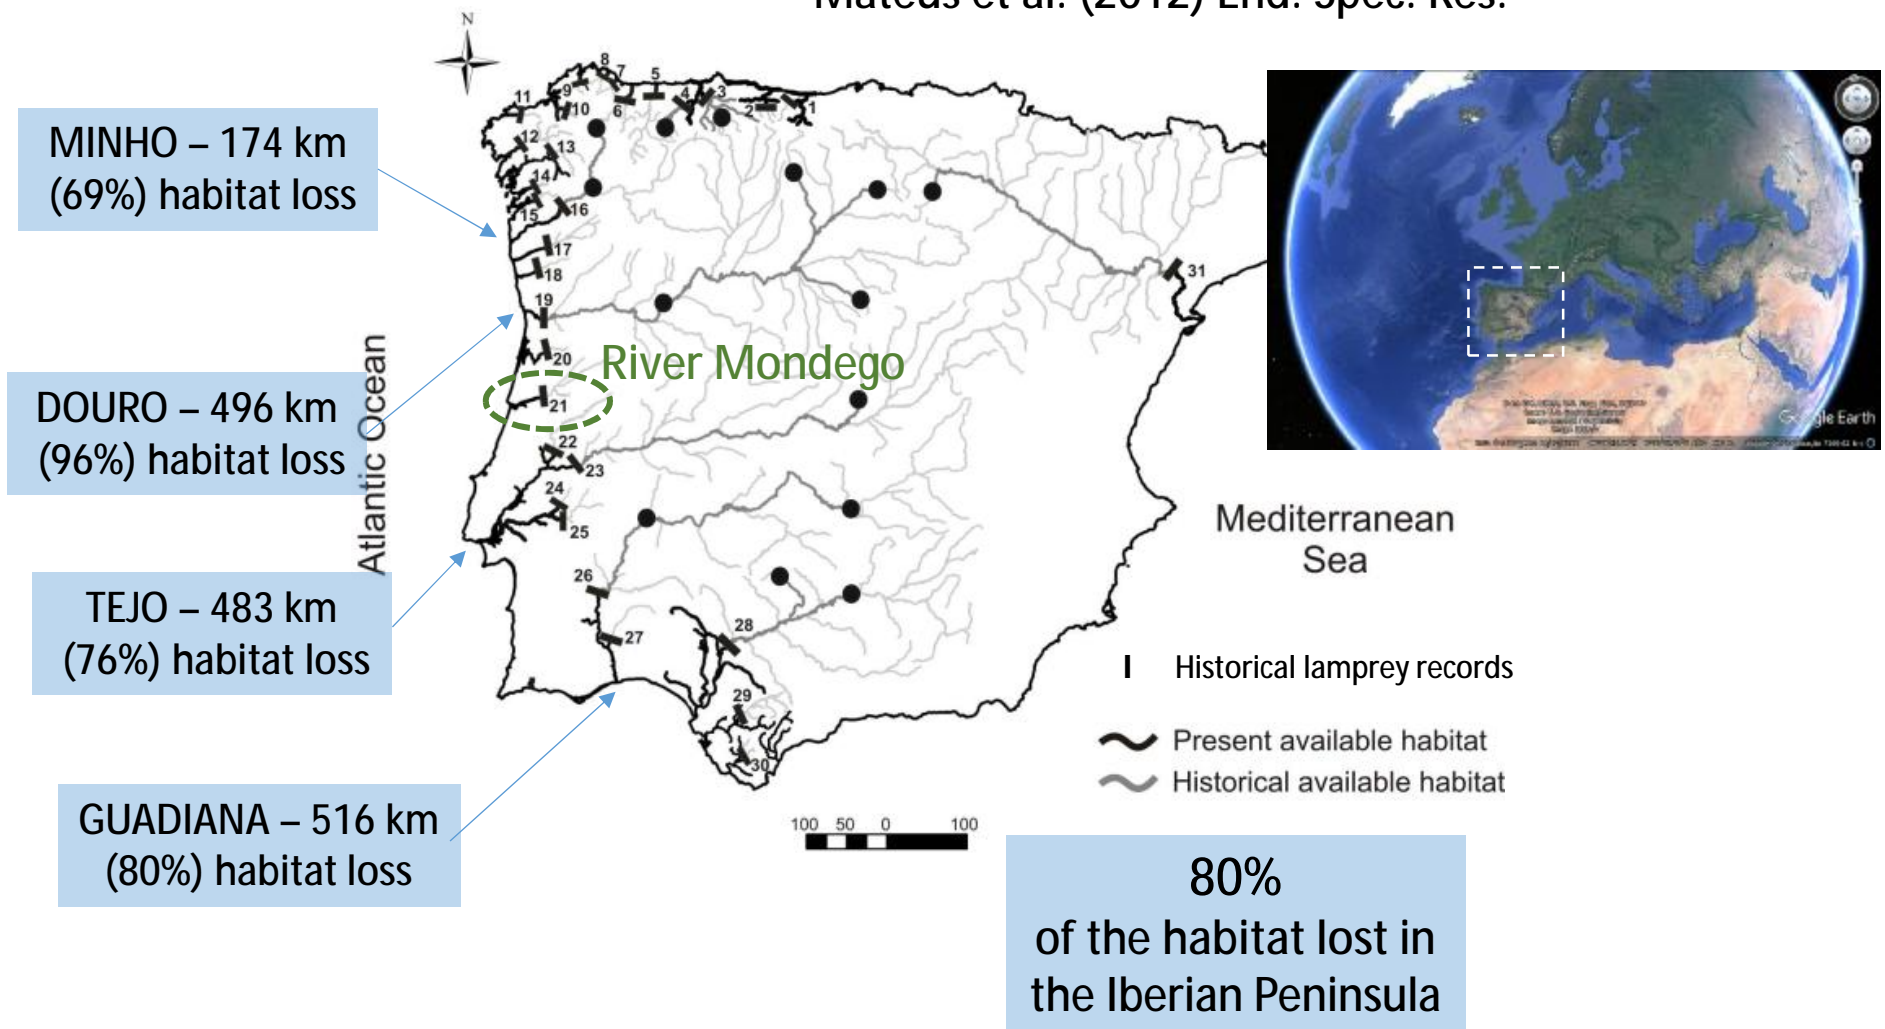

PESQUEIRAS (traps)

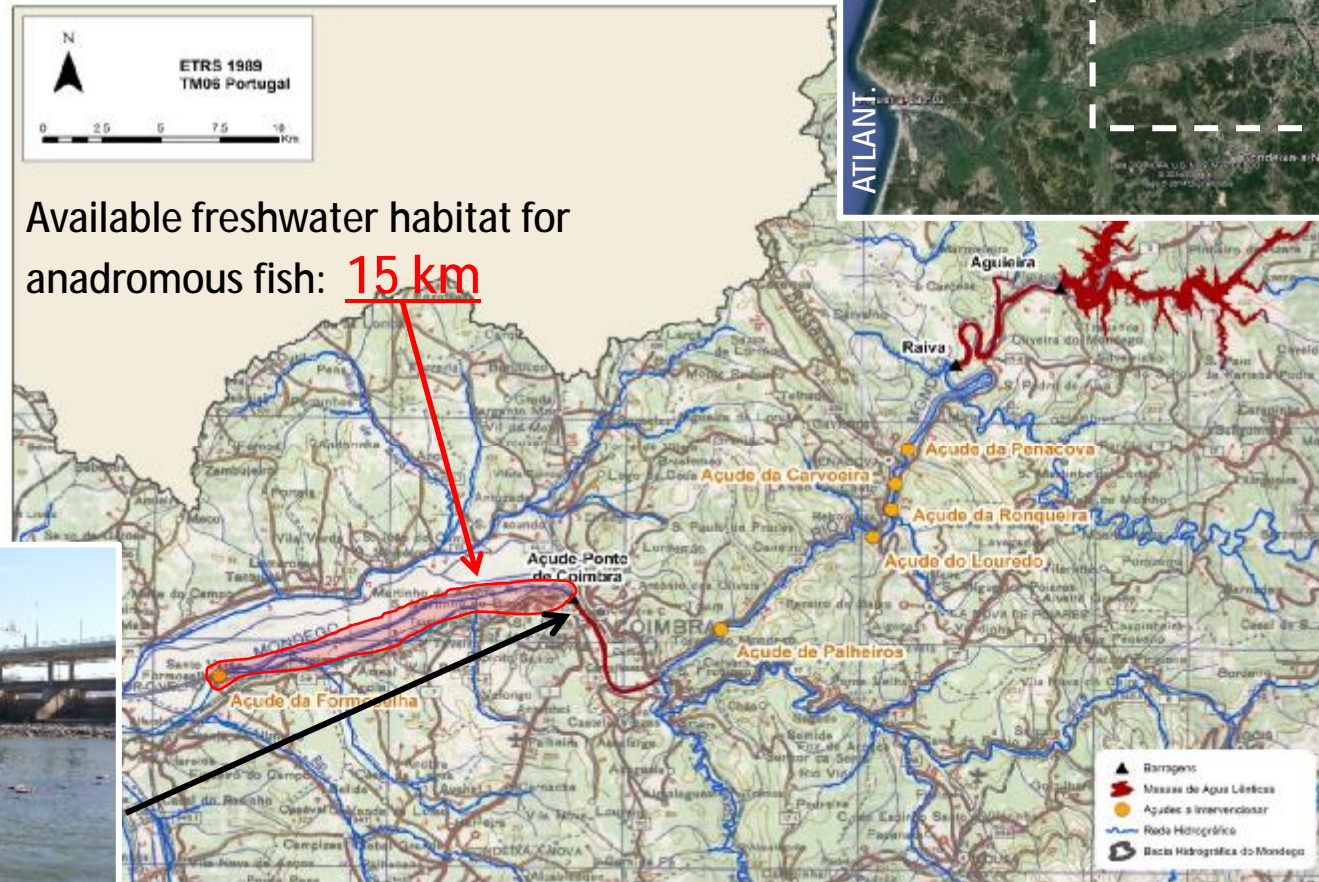

Threats – obstacles to migration

Mateus et al. (2012) End. Spec. Res.

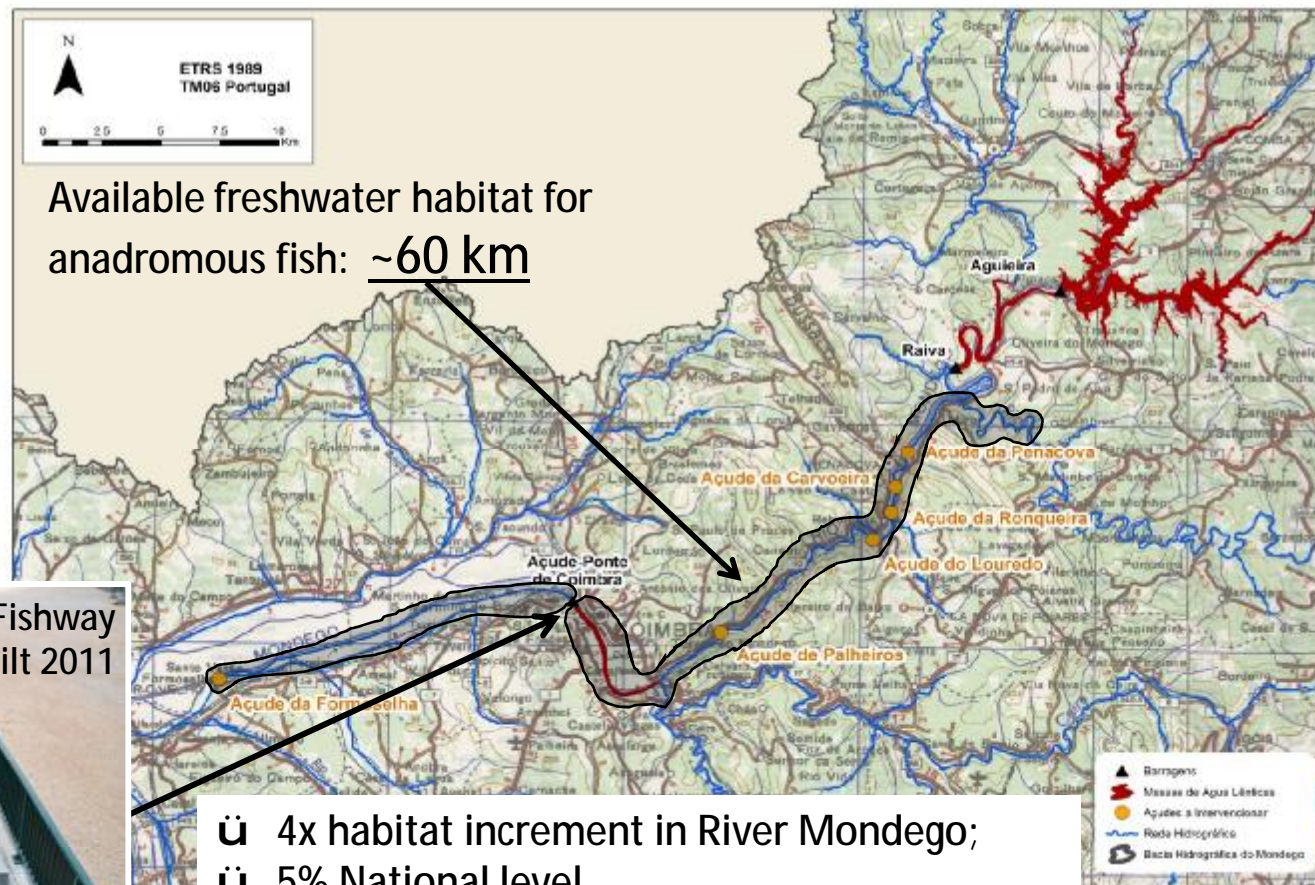

River Mondego

Coimbra Dam

River Mondego

Available freshwater habitat for anadromous fish: ~60 km

Coimbra Fishway
Built 2011

- ü 4x habitat increment in River Mondego;
- ü 5% National level

Coimbra Dam/fishway

Top view

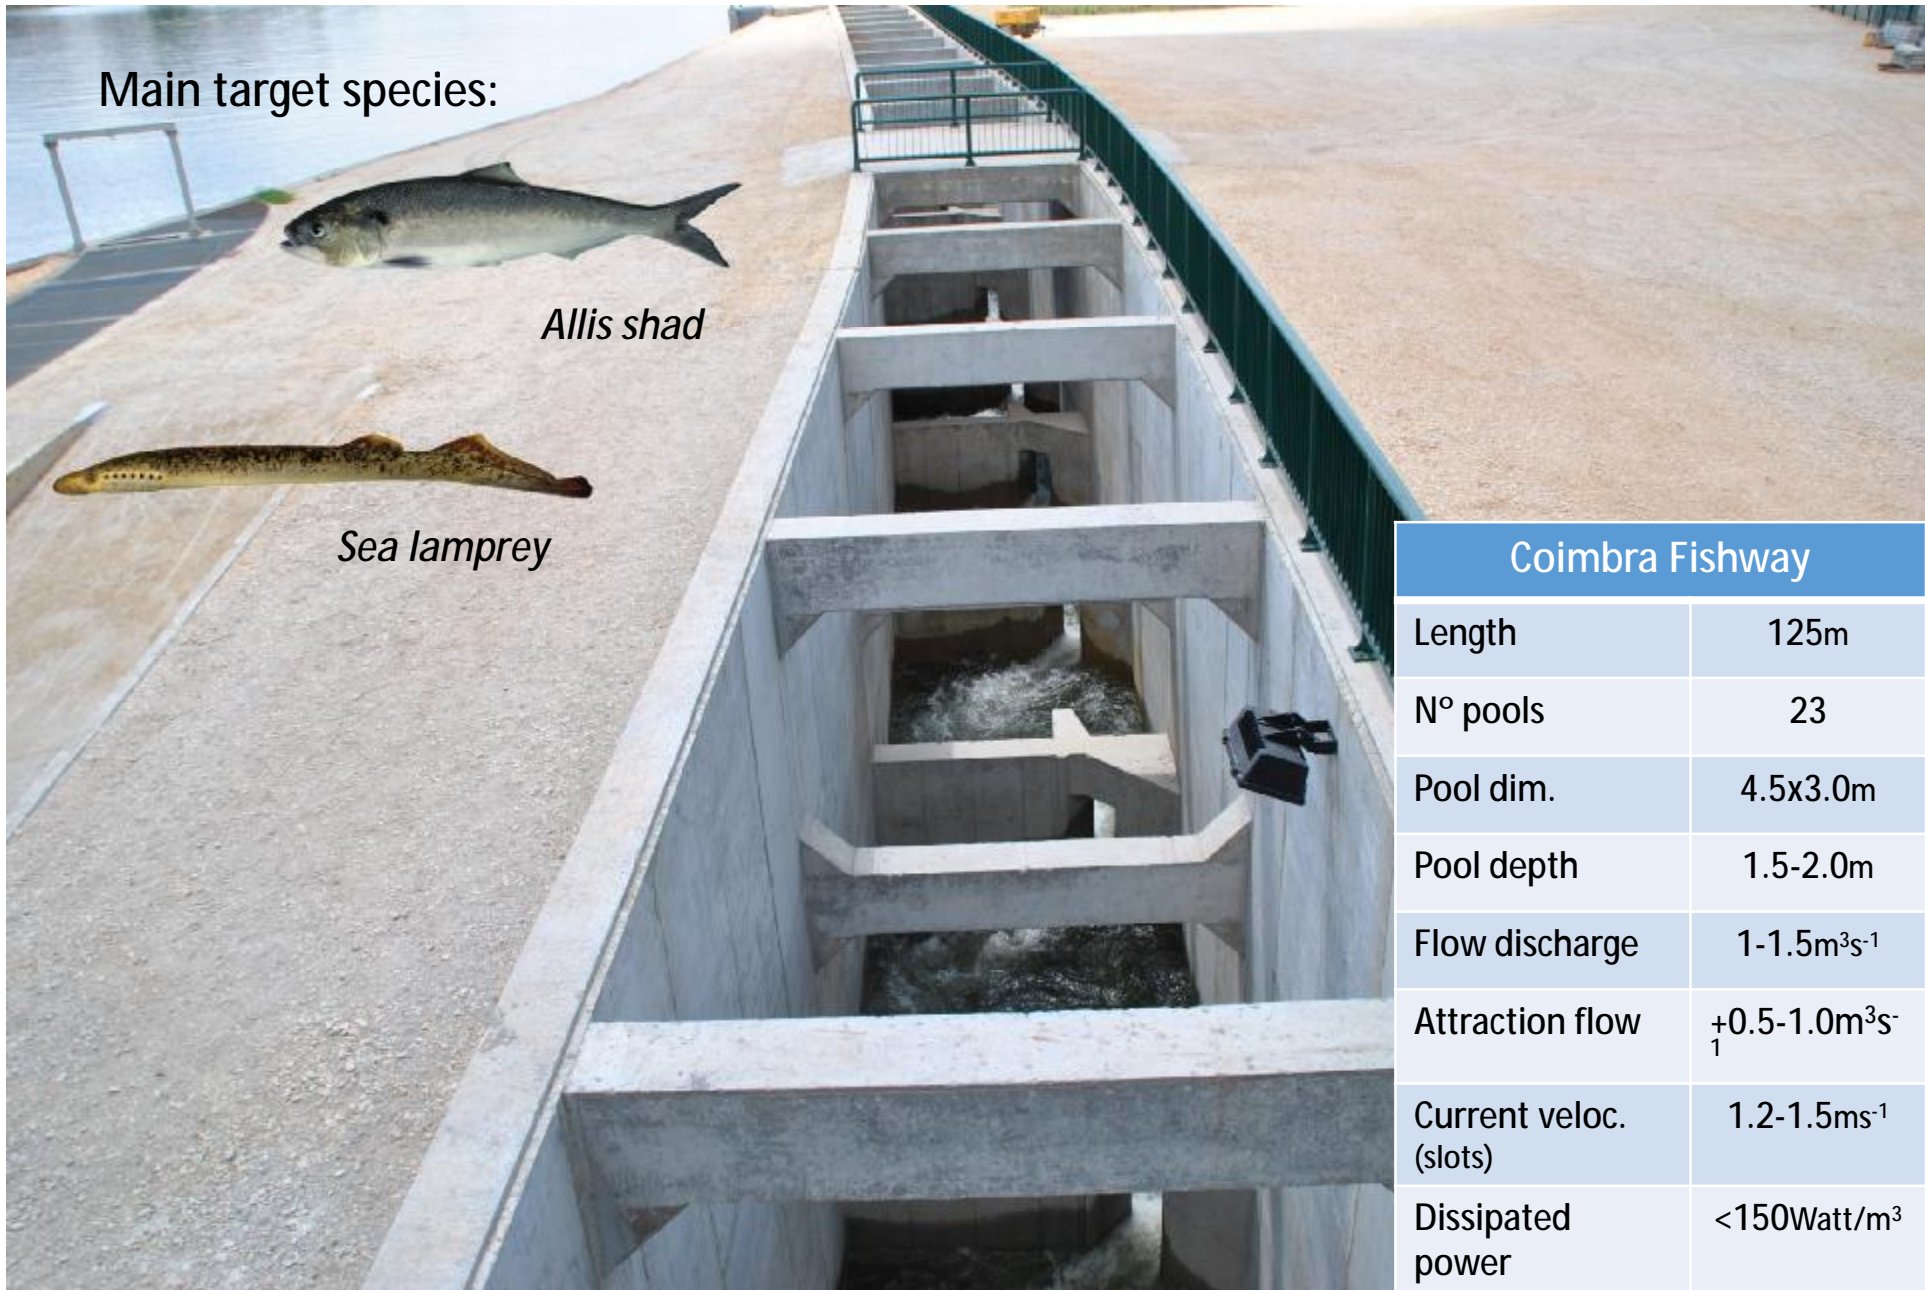

Main target species:

Allis shad

Sea lamprey

Coimbra Fishway	
Length	125m
Nº pools	23
Pool dim.	4.5x3.0m
Pool depth	1.5-2.0m
Flow discharge	1-1.5m ³ s ⁻¹
Attraction flow	±0.5-1.0m ³ s ⁻¹
Current veloc. (slots)	1.2-1.5ms ⁻¹
Dissipated power	<150Watt/m ³

Attraction efficiency - methods

- 4 spawning seasons 2013-2016
- Continuous video recording system
- Sea lamprey counts made a posteriori
- Statistical models - relate environmental predictors with counts

Monitoring window

Video camera

Image recording system

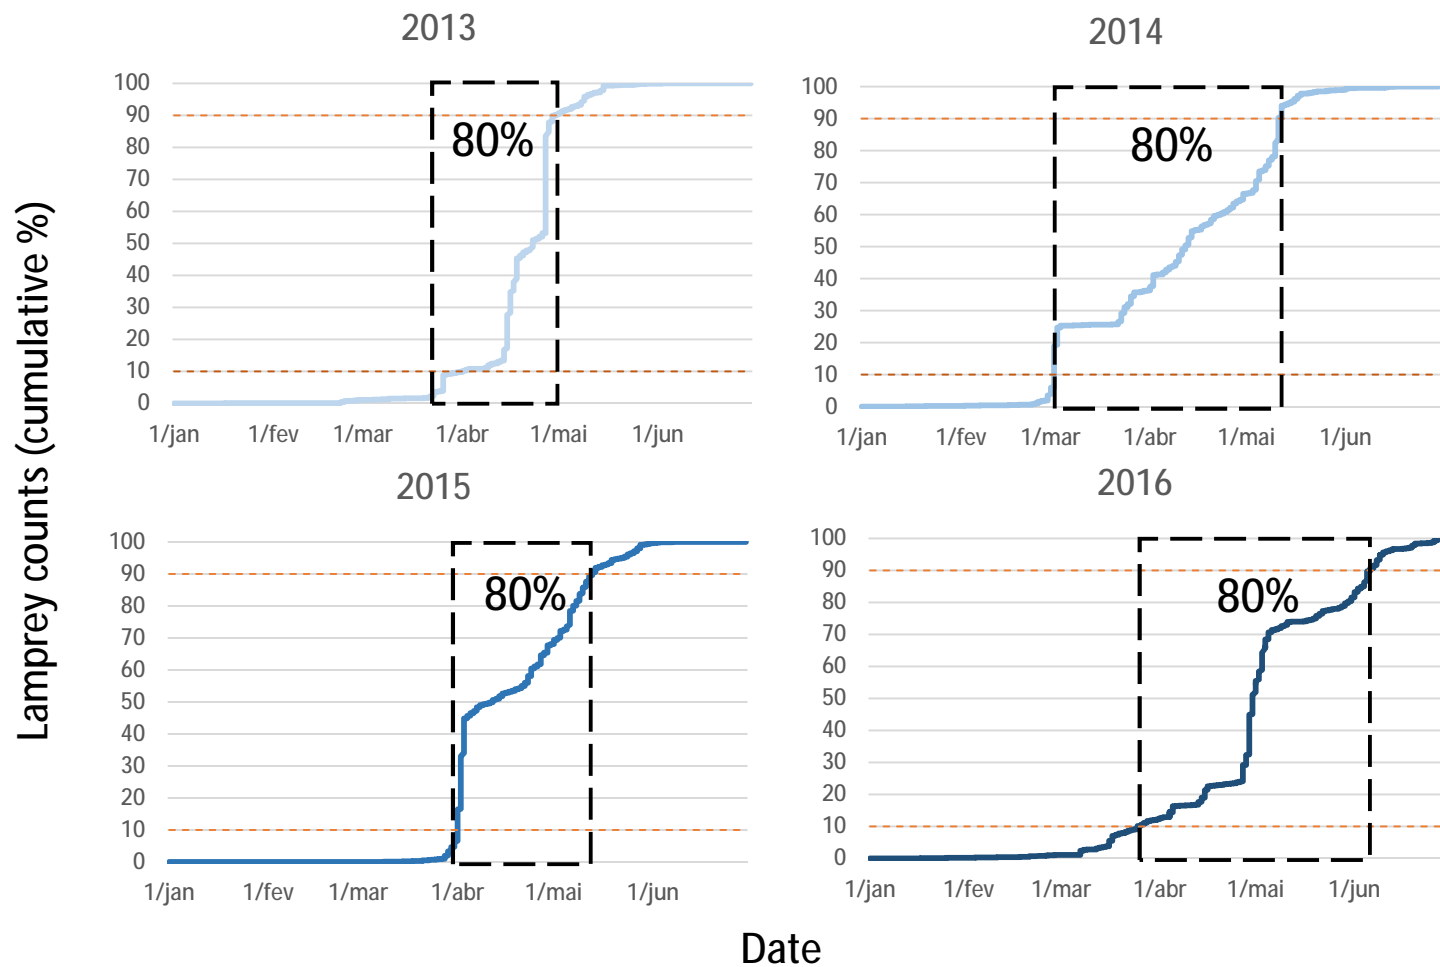

Attraction efficiency - counts

Attraction efficiency - counts

Set of data used (subsample - peak of spawning migration)

Attraction efficiency - predictors

Pre-selected predictors to relate with the sea lamprey counts:

- Water temperature (Temp - °C)
- Specific Conductivity (SpeCon - $\mu\text{S}/\text{cm}$)
- Turbidity (Turb - FNU)
- Discharge Flow (Flow - m^3/s)
- Lunar Cycle (LunCyc – Full Moon; Last Quarter; New Moon; First Quarter)
- Day Period (DayPer - Night, Sunrise; Day; Sunset)
- Photoperiod (Phot - Day length in hours)

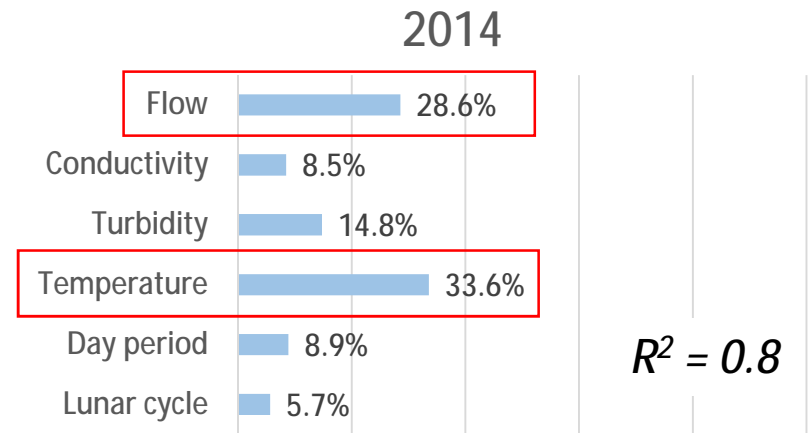

N.B: Variables highly correlated ($r > |0.8|$) were excluded from the analysis

Attraction efficiency – BRT model

Predictors explanatory percentages:

Attraction efficiency – BRT model

Flow: low flows increase the attraction efficiency for sea lamprey

Attraction efficiency – BRT model

Flow: low flows increase the attraction efficiency for sea lamprey

400 m³/s
(High flow)

20 m³/s
(Low flow)

Attraction efficiency – BRT model

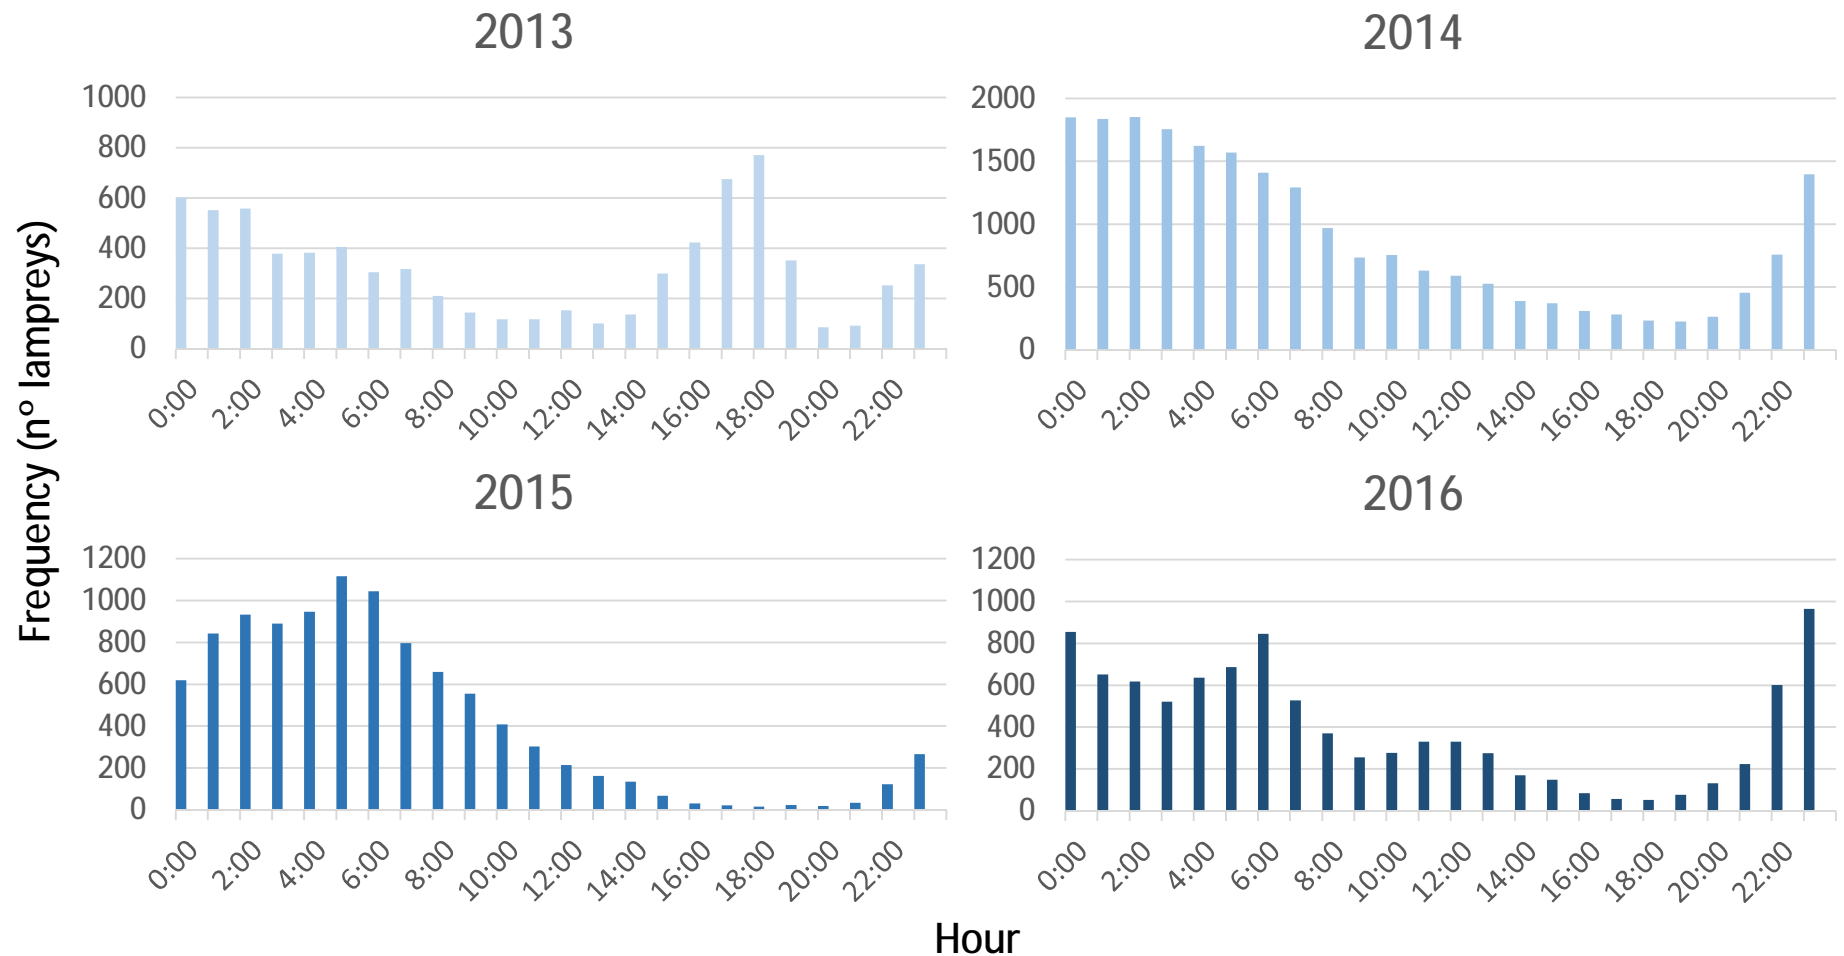

Temperature: peak of activity from 15-19 °C

Attraction efficiency – BRT model

Day period: nocturnal activity pattern during fishway negotiation

Passage efficiency – PIT tagging

Passage efficiency – PIT tagging

PIT tagging 2014 spawning season

Time between release and 1st detection at the fishway PIT antenna

■ Successful
■ Unsuccessful

Fishway efficiency

#225 sea lampreys PIT tagged in April 2014

Fishway efficiency for lampreys

PIT tagging 2015 spawning season

Fishway efficiency

#103 sea lampreys PIT tagged Jan-Apr 2015

Pre a post operational monitoring

Pre a post operational monitoring – lamprey abundance

Pre a post operational monitoring

Pre a post operational monitoring – lamprey abundance

Conclusions

- Attraction efficiency of Coimbra fishway for sea lamprey is mainly conditioned by flow and temperature;
- It is possible to improve the attractiveness of the fishway through flow regulation (3 large dams upstream) during a certain period of the spawning migration (water reach 14-18°C temperature) and night period;
- Passage efficiency can be improved but 30% was enough to promote a 38x increment in ammocoete abundance in the upstream stretch.
