This Event is brought to you for free and open access by the Fish Passage Community at UMass Amherst at ScholarWorks@UMass Amherst. It has been accepted for inclusion in International Conference on Engineering and Ecohydrology for Fish Passage by an authorized administrator of ScholarWorks@UMass Amherst. For more information, please contact scholarworks@library.umass.edu.

Research project Wachstums Kern Flussstrom Plus

- Six projects focused on energy conversion using free-stream water power plants with low ecological impact
- Projects: small-scale hydro power plants, fish monitoring, valuation and certification, development of technical components...

Numerical Investigation of the Influence of a Guide Wall in a Fish-Friendly Weir

Stephanie Müller
Olivier Cleynen
Dominique Thévenin

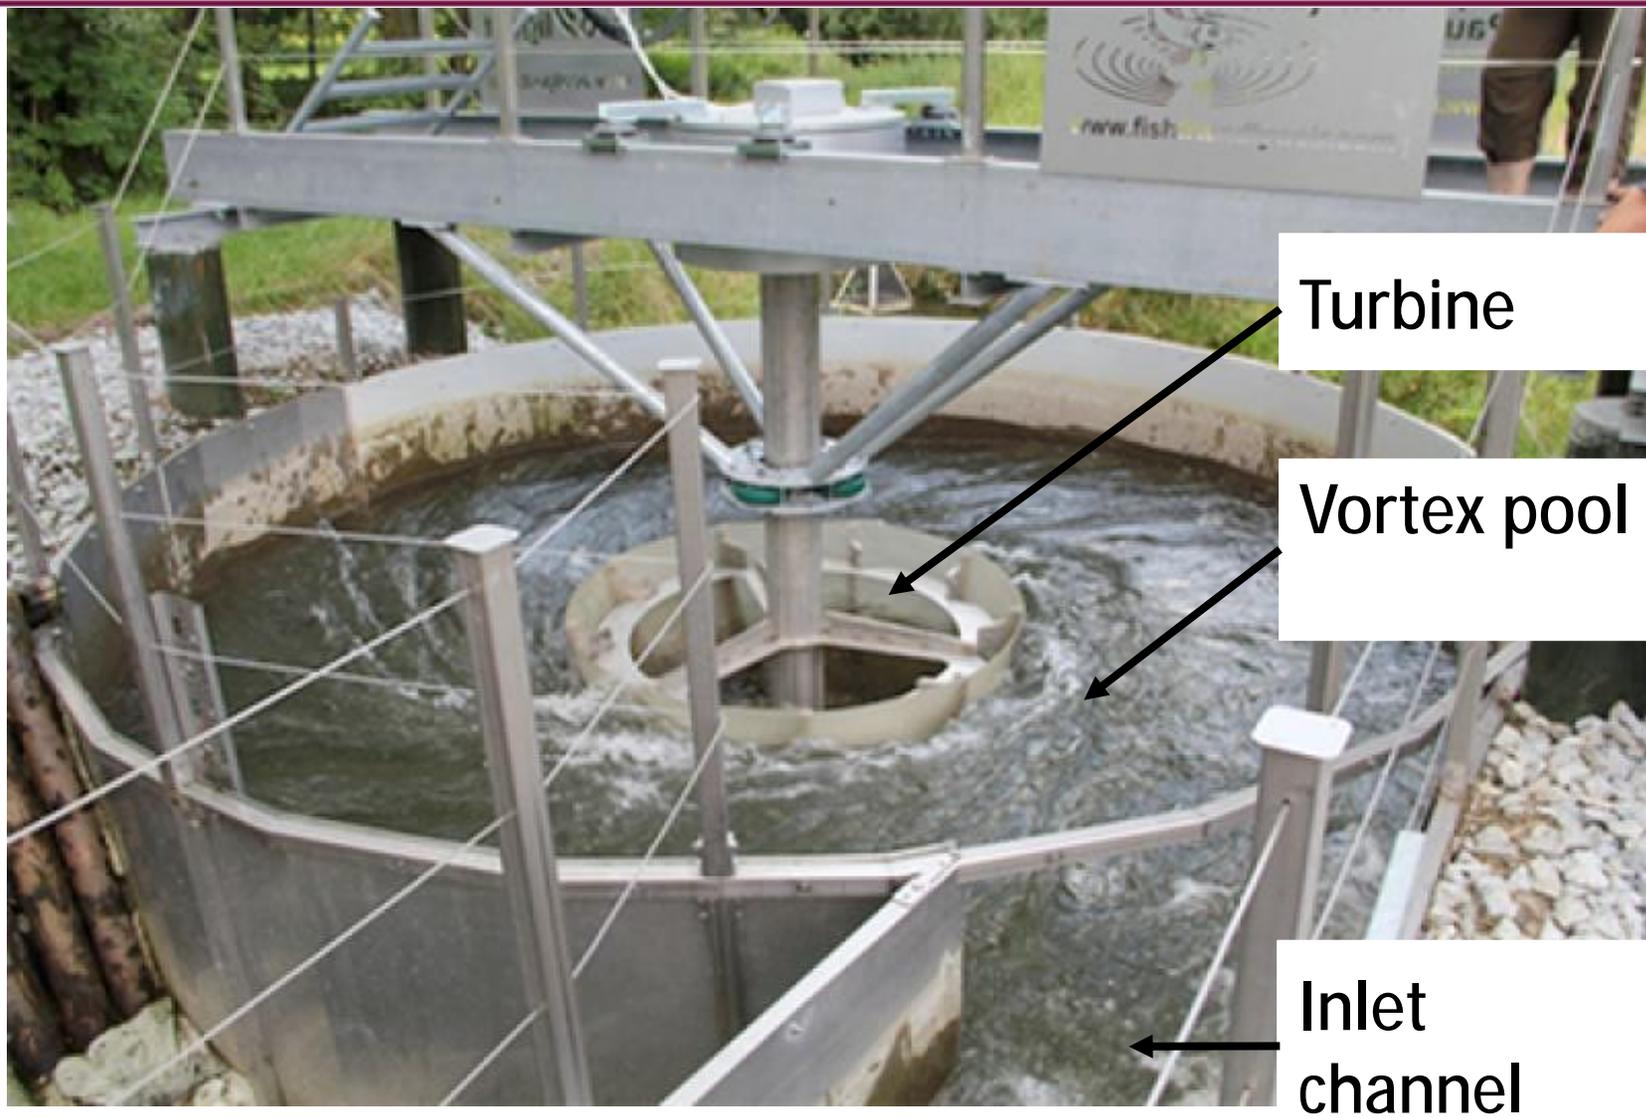

Project: Fish-Friendly Weir

- Numerical investigation of various geometrical parameters
 - ┆ Without & with turbine
 - ┆ Guide wall
 - ┆ Turbine clearance, number of blades ...
- Volume of fluid (VOF) method – 2 phase multiphase simulations (water & air)
- Unsteady, Reynolds-Averaged Navier-Stokes (RANS)

STAR-CCM+

Simulation Settings

- Simulation software: Star-CCM+ V11
- Multiphase simulations (water & air)
- Settings:
 - ┆ 850 l/s, max. velocity at the inlet: 1.08 m/s
 - ┆ k-omega-SST turbulence model
 - ┆ Mass-flow inlet boundary condition

without turbine:

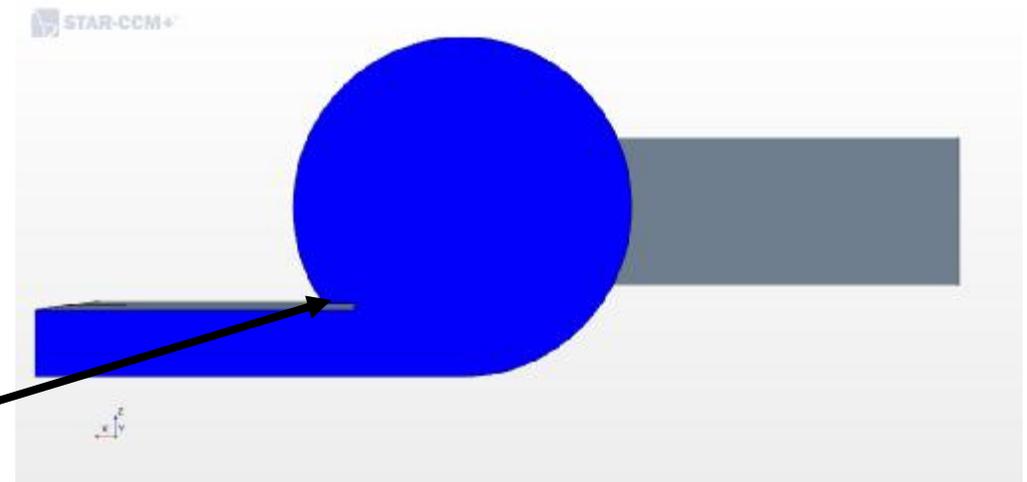

- ~1 mio. Cells
- HPC-Cluster: 48 cores
- Adaptive timestep & mesh

with turbine:

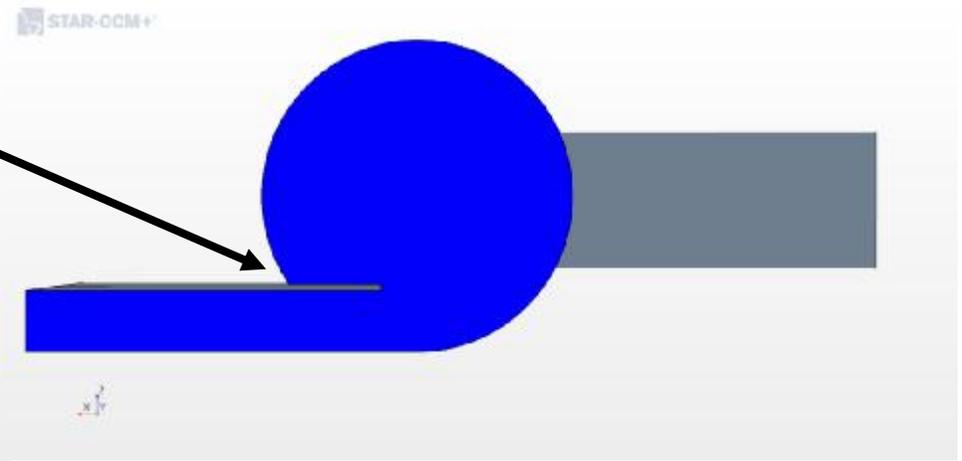

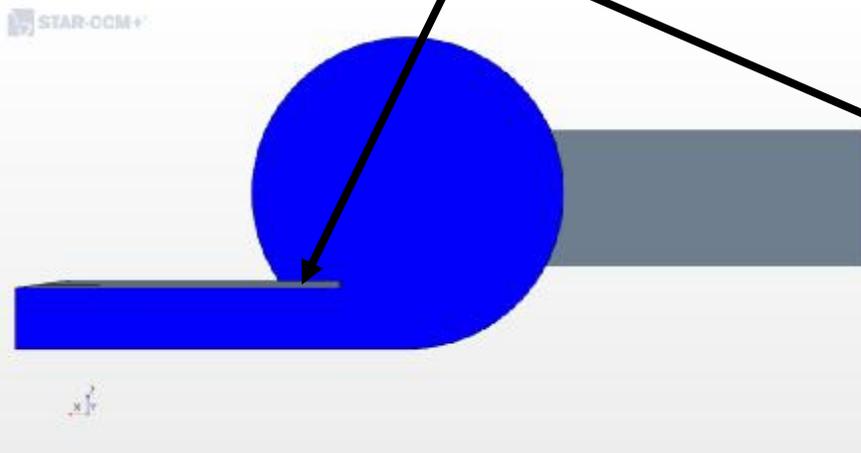

- ~4 mio. Cells
- HPC-Cluster: 128 cores

Guide wall

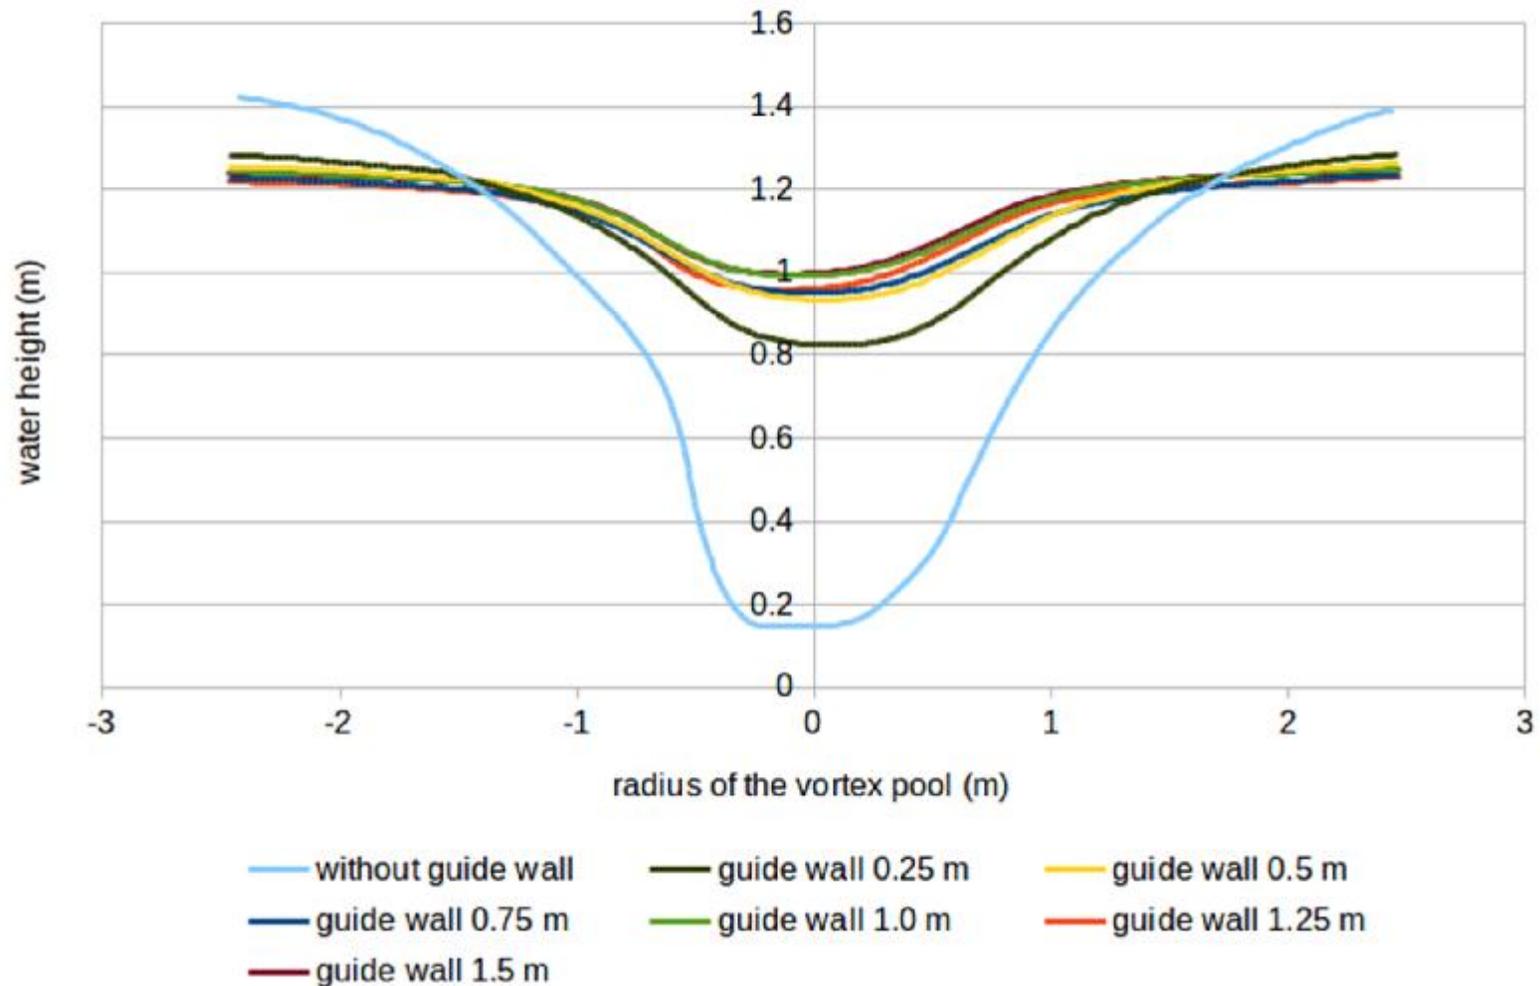

- Without guide wall
- 6 different lengths of the guide wall (0.25 m to 1.5 m)

Guide wall

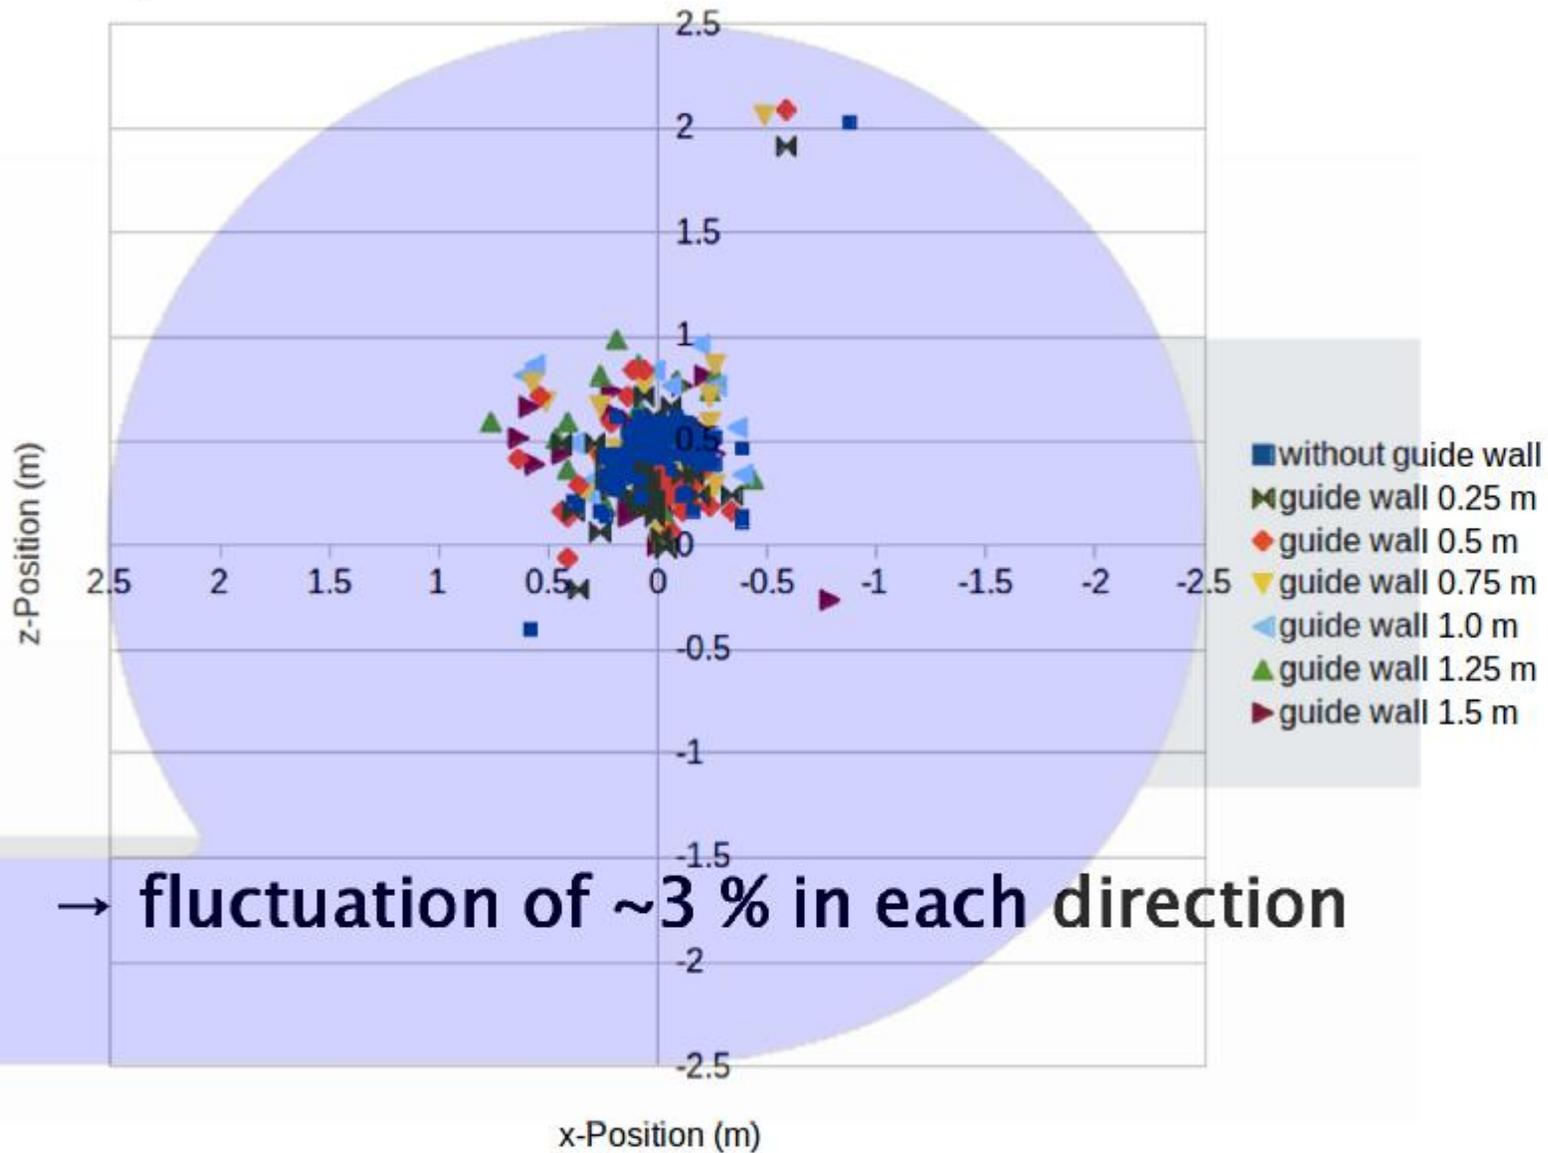

Vortex depth

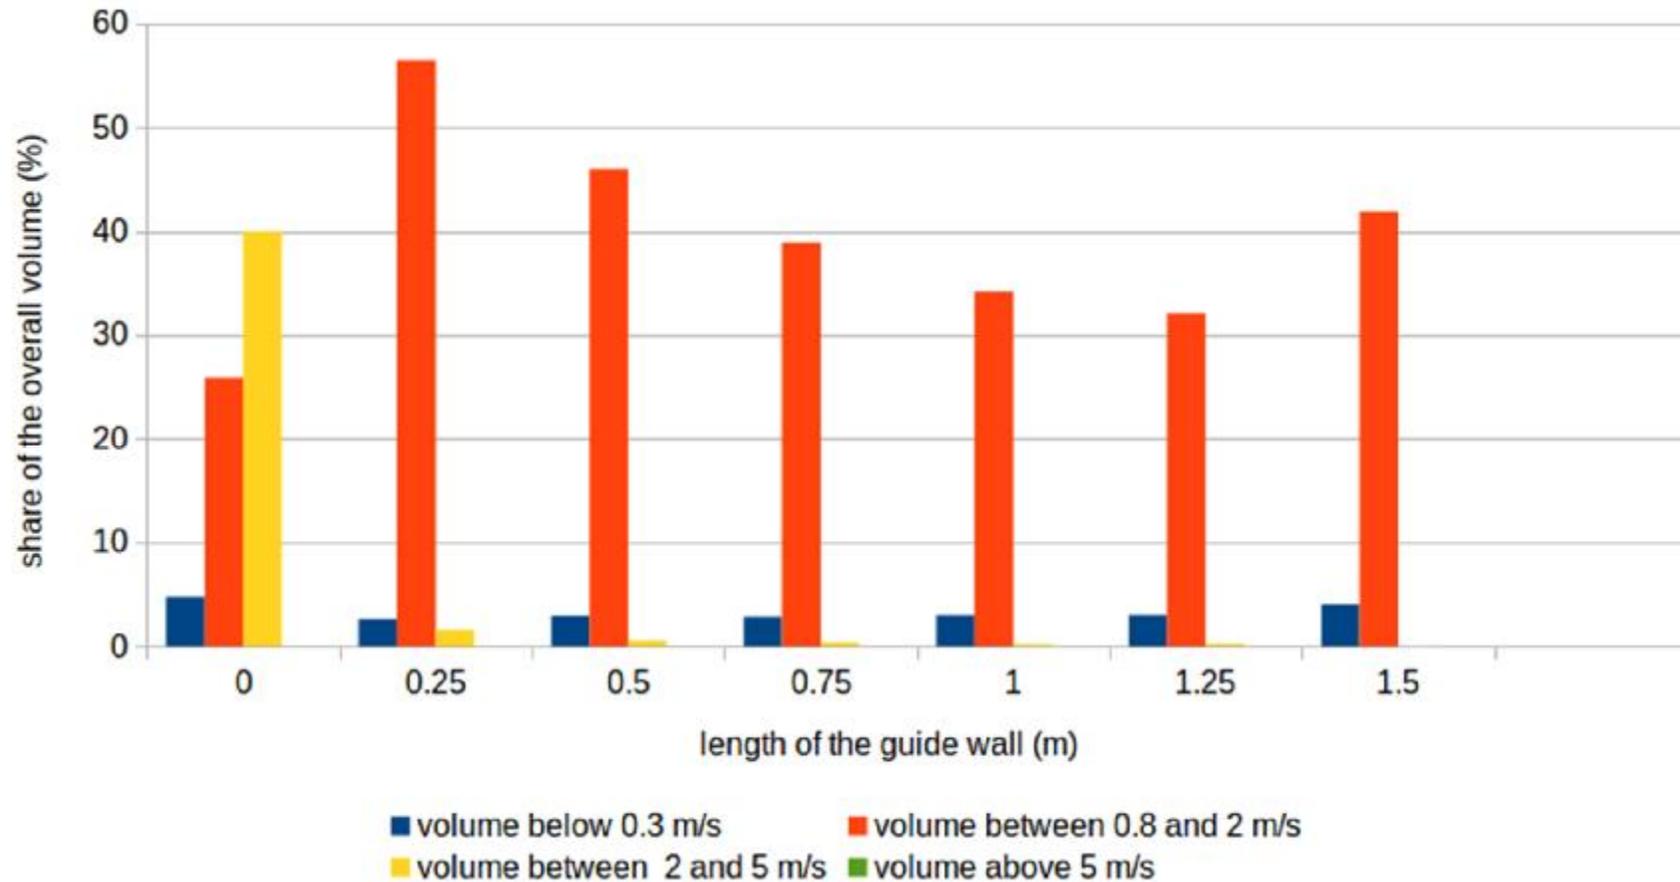

→ shallower and flatter vortices

Vortex position

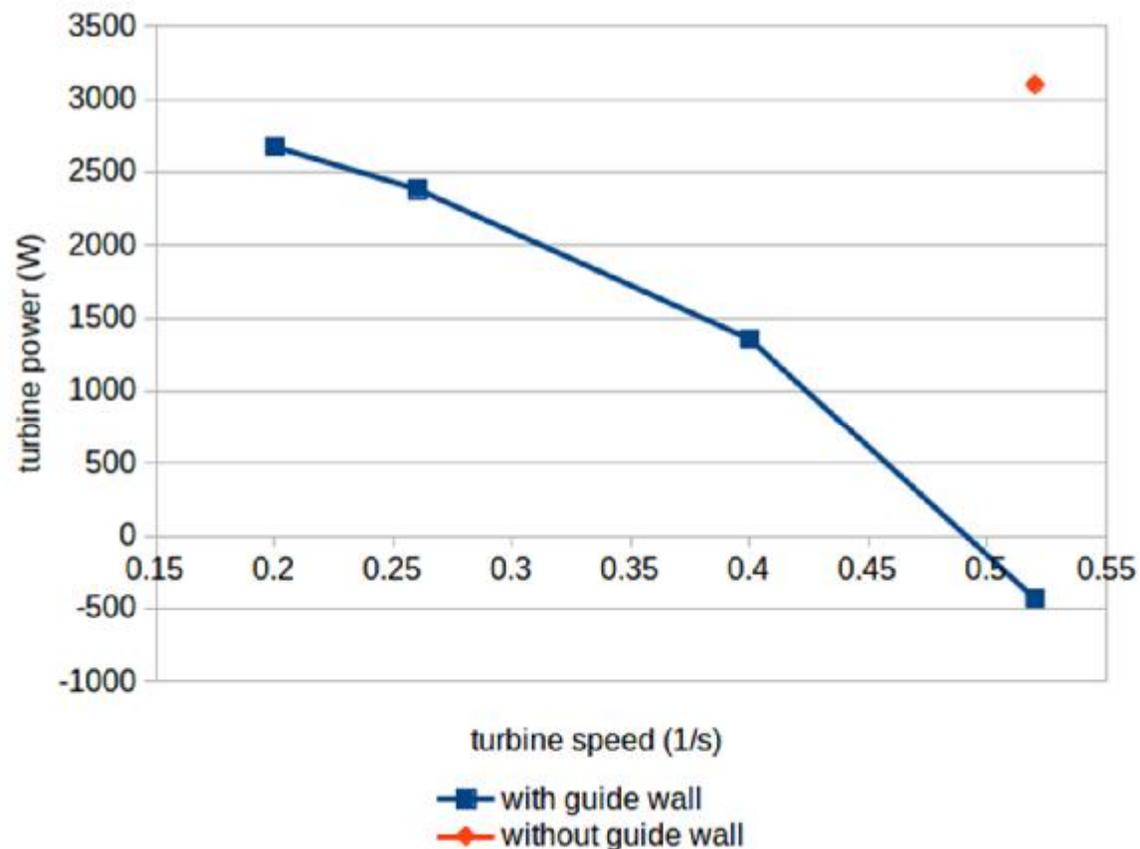

Influence of the guide wall on the velocities

→ shifting of the velocity distribution

Adaptation of the turbine speed

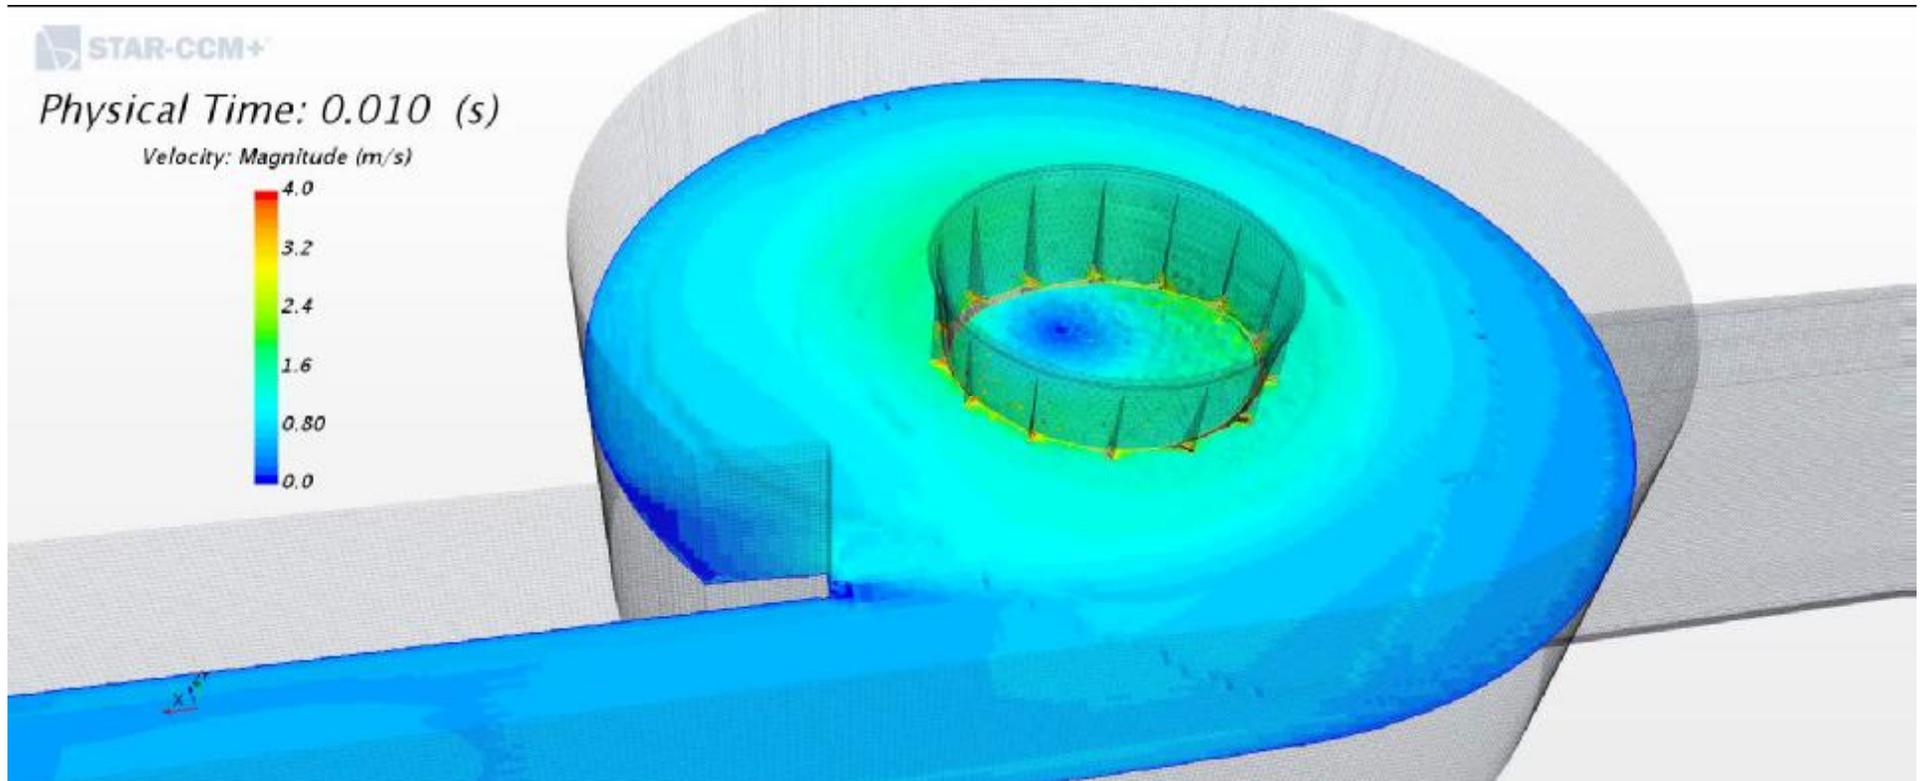

- Guide wall length: 0.5 m, volume flow rate: 850 l/s

→ acceptable difference in power

Conclusion – usage of a guide wall

- Benefits regarding the requirements of fish passage
- Turbine velocity must be adapted to maintain power

Conclusion – usage of CFD

- Complementary to experiments
- Allows:
 - Insight into the flow
 - Analysis of influence of geometrical parameters
 - Estimation of the compliance of fish passage requirements
 - Identification of potential for improvement
- Opportunity to guide and optimize fish experiments (?)
- But: long computational times, high computational resources

Thank you for your attention!
