Daten verankerter Strömungsmesser von JASIN 1978

Zusammenfassung

Nach einer kurzen Darstellung der mittleren hydrographischen Verhältnisse aus dem inneren Meßgebiet von JASIN (59° N, $12^{\circ} 30'$ W) werden Daten aus Verankerungen K1, K2 und K3 in Form von Vektorzeitreihen, Zeitreihen der Komponenten als fortschreitende Vektordiagramme und in Häufigkeitsverteilungen dargestellt. K1 war eine Unterwasserverankerung mit 7 Aanderaa-Strömungsmessern in den oberen 1000 m. Bei K2 handelte es sich um eine doppelseitig verankerte formstabilisierte Oberflächenboje mit 6 VACM-Strömungsmessern und zusätzlichen Temperaturmeßgeräten im oberen Bereich der Sprungschicht. Zwei vertikal parallel angeordnete Thermistorketten im Tiefenbereich 2—82 m bildeten das Herzstück der K3, welche ebenso wie K2 mit meteorologischen Sensoren ausgestattet war. Die Verankerungen haben während mehrerer Wochen im Sommer 1978 Beobachtungswerte aufgezeichnet.

Summary

After a short presentation of mean hydrographic conditions at the Fixed Intensive Array of JASIN (59° N, $12^{\circ} 30'$ W) data from moorings K1, K2 and K3 are given as stick plots and component time series, progressive vector diagrams, and frequency distributions. K1 was a subsurface mooring with 7 Aanderaa current meters in the upper 1000 m. K2 was equipped with a spar buoy carrying 6 VACMs and some additional temperature sensors in the upper thermocline. Two vertical and parallel thermistor chains in the depth range 2—82 m were the main sensor arrays of K3, which, like K2, was also equipped with meteorological sensors. Data from these moorings were obtained during several weeks in the summer of 1978.

1. Moorings

The international Joint Air-Sea Interaction Project JASIN 1978 included meteorological and oceanographic observations in the eastern North Atlantic west of Scotland. The main objectives of this programme and the field activities on research platforms from the Federal Republic of Germany were summarized by SIEDLER & ZENK (1980).

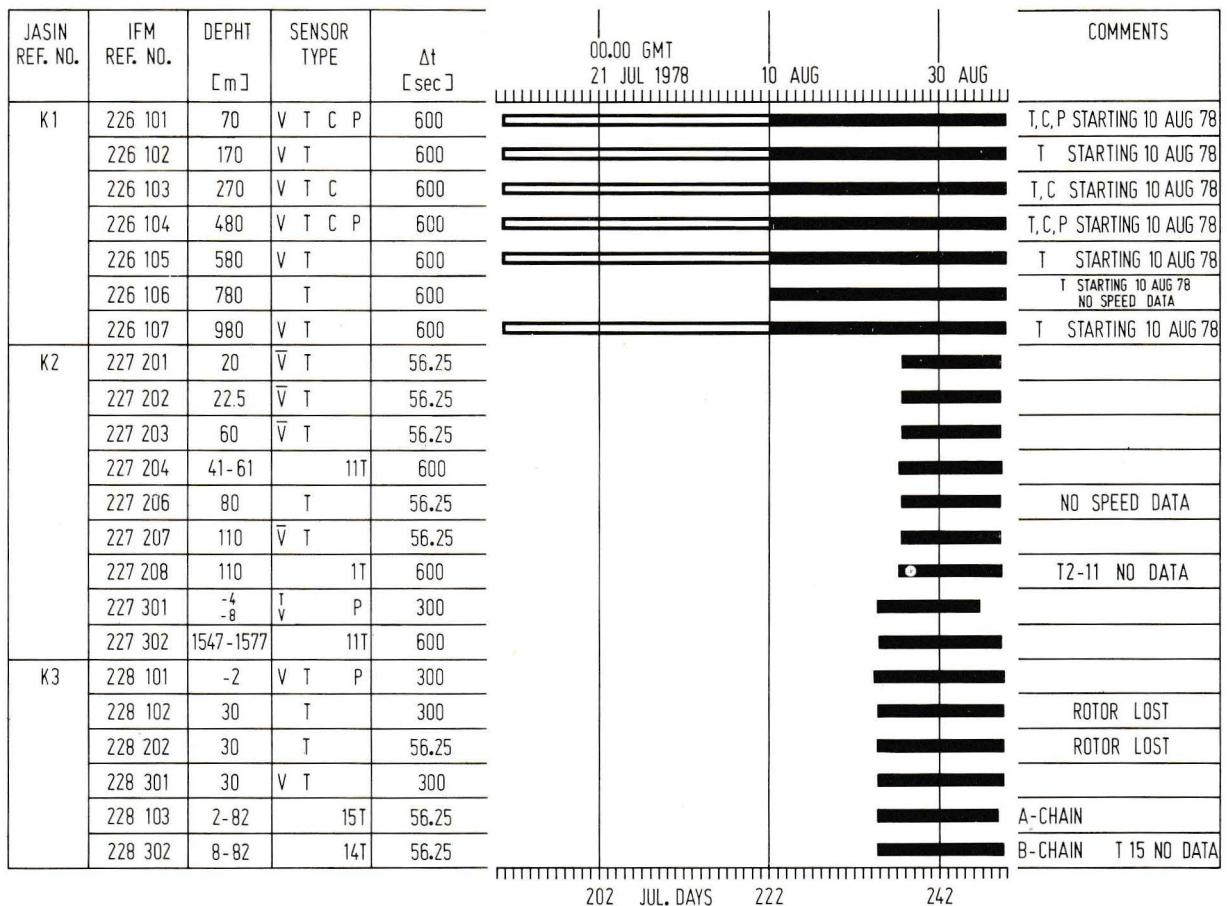

Three current meter moorings with self-recording instruments were deployed by the German participants in the Fixed Intensive Array (FIA). K1 was a single-point sub-surface mooring with 7 Aanderaa current meters and a small surface marker attached to the uppermost float. It served studies of the vertical structure of the internal wave field in the water column below 100 m. K2 included a spar buoy with 6 Vector Averaging Current Meters (VACM) and 2 Aanderaa thermistor chains suspended below. The spar buoy was tethered to 2 surface moorings. It allowed observations of the current and temperature stratification in the upper 110 m needed for mixed layer structure and internal wave studies. K3 was a surface mooring with a H-shaped thermistor chain array with drogue attached, its purpose being the observation of temperature microstructure variability in the mixed layer. Both K2 and K3 carried an Aanderaa meteorological package on a surface buoy. Although the moorings were deployed for individual projects, the obtained data supplement each other to some extent and will therefore be presented together in this paper. Analysis of the individual projects will be published separately at a later date.

Detailed figures of the 3 moorings were already shown in SIEDLER & ZENK (1980) before, only simpli-

Table 1. Summary of available data from JASIN moorings K1, K2 and K3. Because of instrument displacements due to mooring motion caused by strong barotropic currents, data from the period before 10 August 1978 should be interpreted with caution.

Tabelle 1. Zusammenfassung aller verfügbarer Daten der JASIN-Verankerung K1, K2 und K3. Wegen Geräteverlagerungen infolge von Verankerungseigenbewegungen, die durch starke barotrope Ströme hervorgerufen wurden, sollten die Daten aus dem Zeitraum vor dem 10. August 1978 mit Vorsicht ausgewertet werden.

fied schematics including the IfM reference numbers are therefore presented in Fig. 1. The available data and mooring positions are summarized in Tables 1 and 2, including some general comments on data quality.

Particular effort was made to calibrate the thermistor chains of mooring K3 before the experiment. Groups of 16 sensors were calibrated at 7 temperatures, with reference to a quartz thermometer. The data points were fitted by a spline procedure. The resolution obtained was $\pm 0.003^\circ\text{C}$. The data were recorded on Sea Data tape cassettes and transferred to computer tape after automatic reading.

Data processing at the Institut für Meereskunde of Aanderaa and VACM instruments followed the standard procedures like those described earlier by KÄSE et al. (1978).

2. Data presentation

As an introduction to the mooring data in Figures 2-3 we present a selection of temperature, salinity and σ_t -profiles, including their standard deviations.

These CTD data originate from Multisonde and Bathysonde observations onboard R.V. "Meteor" and W.F.S. "Planet". "Meteor" operated in the vicinity of our moorings within the three JASIN phases: 8-22 July (Phase 0), 23 July-16 August (Phase 1) and 17 August-16 September 1978 (Phase 2). "Planet" was present during phase 2 only. For logistical details the reader may refer to SIEDLER & ZENK (1980). A report on all stratification data has been prepared by KNOLL (1983). Current meter data from moorings are structured into three groups: K1 figures 4-14b, K2 figures 14c-24, 26, 30 and K3 figures 25, 27-29, 31. After the presentation of stick plot diagrams, progressive vector diagrams are shown. They are followed by grouped time series of current components and temperatures of the individual instruments and frequency distributions of selected temperature and current components.

Meteorological observations are summarized in Figures 30 and 31. A summary of the figure collection is given in Table 3.

Table 2. Mooring positions

Tabelle 2. Positionen der Verankerungen

JASIN ref. no.	IfM ref. no.	φ (N)	λ (W)
K1	226	58° 59.7'	12° 30.5'
K2	227	58° 59.0'	12° 31.0'
K3	228	58° 59.2'	12° 32.3'
