### 1. Introduction

In 1980 Kiel University started the special research programme "Warmwassersphäre" which aims to study the general circulation and related mesoscale processes in the warm water sphere ( $T > 10^{\circ}\text{C}$ ) of the Atlantic Ocean. Part of the programme -in continuation of IfM-Kiel NEADS (North East Atlantic Dynamic Studies) activites - is the experimental investigation of the recirculation regime in the Canary Basin by means of hydrographic sections, satellite tracked drifters and long term mooring sites.

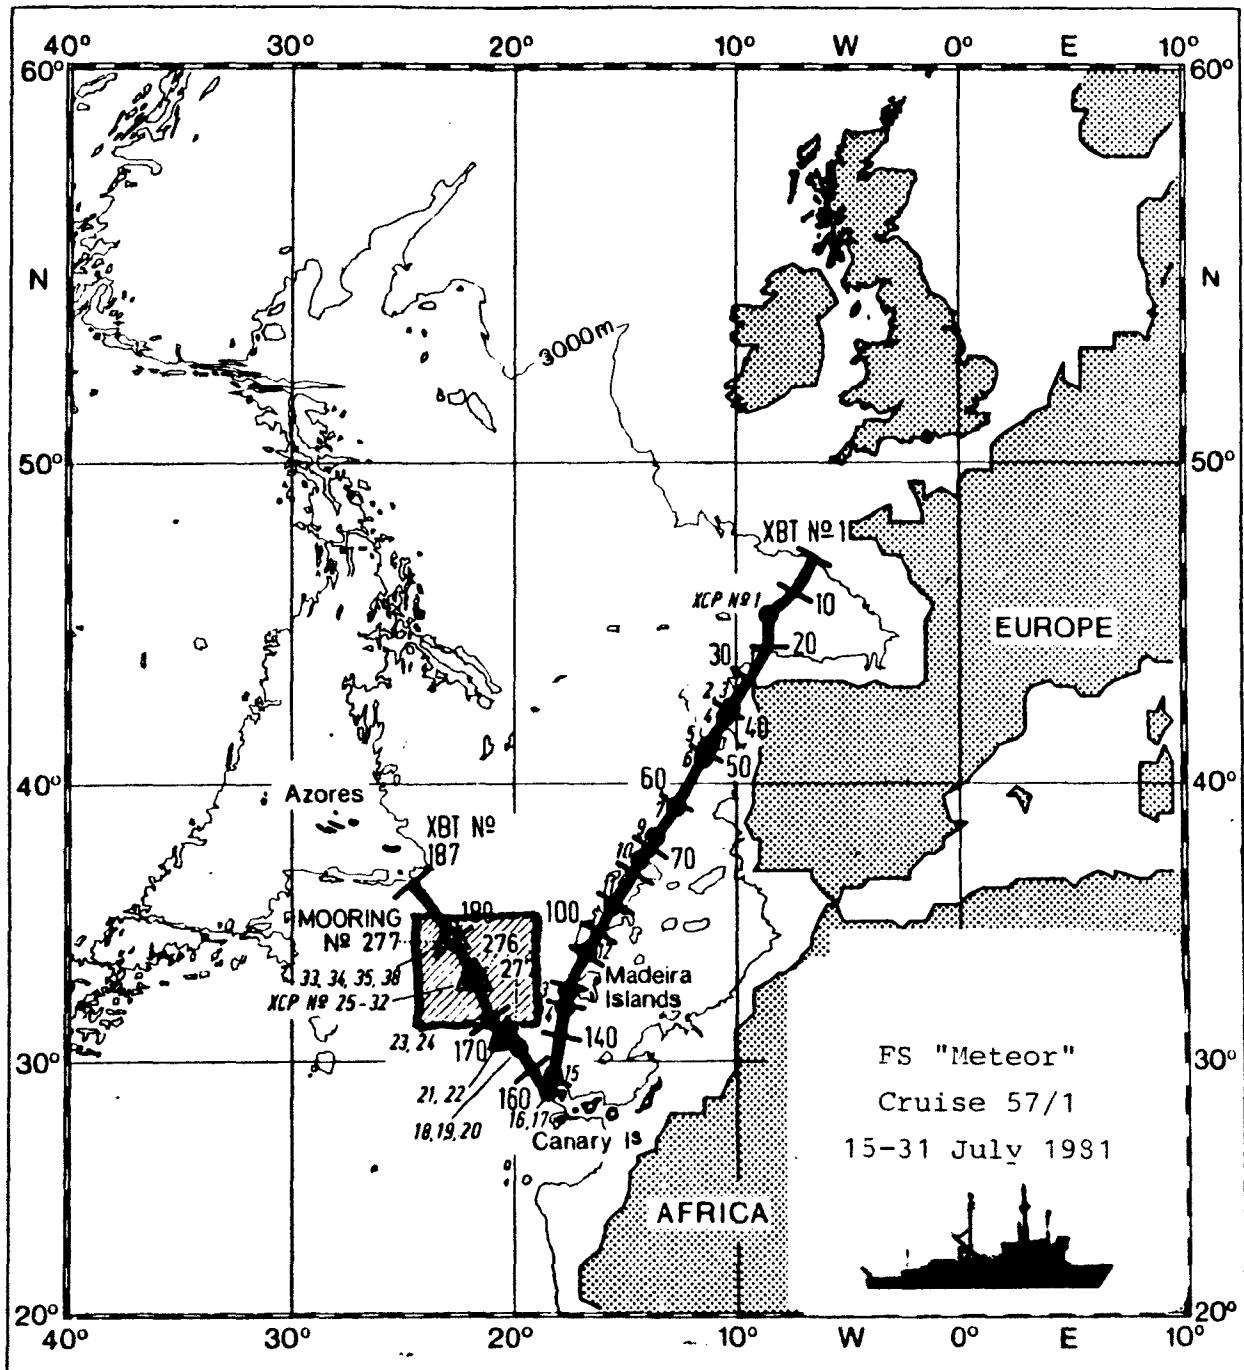

This report mainly compiles the set of current meter data from three mooring sites along a line between the Canary Islands and the Azores which have been obtained between October 1980, July 1981 and March 1982 (see figure 1 and table 1) during METEOR cruises 56/1, 57/1 and 60/3. Also shown is the complete set of an XBT, SST and SSS section from the Gulf of Biscay via the Canaries towards the Azores (figure 1), obtained during METEOR-57/1 in July 1981.

Part of the XBT section is discussed in detail together with XCP\* measurements (Sanford and Spain, 1982) by Käse et al., (1983)<sup>†</sup>. First results from METEOR-60/3 and POSEIDON-87 cruises in March/April 1982 concerning the structure of the oceanic subtropical front in this area have been published by Käse and Siedler (1982).

Previous data are available from mooring position NEADS Site 1, shortly N1, which already had been occupied from January 1977 - December 1977 and from March 1980 - October 1980 (Müller, 1981). In addition to current meters during the October 1980 - March 1982 campagne, two 50m Aanderaa thermistor chains recorded parts of the vertical temperature gradient in the upper thermocline.

\* Expendable Current Profiler

<sup>†</sup> Käse, R.H., W. Zenk, T.B. Sanford, and W. Hiller, 1983:  
Currents, fronts and eddy fluxes in the Canary Basin  
(in preparation).

**Fig. 1:** Track lines of FS "Meteor", cruise 57/1, July 1981 (Azores-Canary Islands, Canary-Islands-Bay of Biscaya). On both sections surface temperature and salinity observations (SST, SSS), expendable bathythermograph (XBT) and expendable current profiler data (XCP) were collected. Mooring sites N1(276), N11(277) and N12(278) as parts of the international North Eastern Atlantic Dynamic Studies were located in the central Canary Basin. The shaded area indicates CTD and drifter studies in April 1982 reported by Käse and Siedler (1982).

Identification	Position, water-depth	depth m	available current meter data	
			1980	1981   1982
NEADS: site 1,N1 IFM: 264* in 1980 276 else	33°N 22°W 5300 m	125- 250 350- 550 630- 755 935-1160 ~1650 ~3000 ~4750		
				continued
NEADS: site 11,N11 IFM: 277	34° 48'N 23° 05'W 5155 m	~250 ~550 ~800 ~1200 ~1650 ~3000 ~4700		
				continued
NEADS: site 12,N12 IFM: 278	31° 00'N 20° 30'W 4850 m	203 524 705 1139 1590 2974 4692		

Table 1: Available current meter data from NEADS sites 1, 11 and 12. Data from site 1, 1980,  
IFM mooring 264 is reported in Müller (1981).

Positions N11 and N12 accomplish a non-coherent section across the recirculation regime between the Canaries and the Azores.

The presentation of current meter data is split up into two parts: first the statistics and high frequency spectra ( $\omega > 1/512$  cph) of pressure, temperature, salinity, and rotary velocity components of unfiltered data at the original sampling rate are shown. They are followed by statistics and time series plots including progressive vector diagrams of low-pass filtered data ( $\omega < 48$  cph).

A detailed data index of the graphics is given in the out-fold of the last page.

## 2. Data processing

Data processing for both moored instruments and XBTs was more or less standard and is reviewed briefly in the following sections.

### 2.1. Current meters and thermistor chains

#### 2.1.1. Quality control

All but one current meters and all thermistor-chains (50 m length with 11 sensors each) were of Aanderaa-type. Also, one acoustically measuring current meter manufactured by Neil Brown Instruments (ACM-2) was deployed in a region of weak mean current (N1, 276207, 1665 m).

After decoding the recorded tapes and converting raw data to physical units using manufacturer's or our own coefficients, each record was inspected for correct time base, and spikes were removed. The instrument depths were corrected using pressure records, and temperature and salinity were compared to our own CTDs at the start and end of records as well as with historical IGY-data (deep ocean >3000 m only, Fuglister, 1960).

Thus the mean values for temperatures and salinities in the statistics may not be independent from other measurements. The tables preceding the graphics for each mooring inform about all corrections in detail.

With the exception of the ACM-2 instrument, accuracies in temperature and salinity seem to be  $\pm 0.05$  K and  $\pm 0.1 \cdot 10^{-3}$ , respectively, for depths down to 1700 m. Some trends in salinity are still obvious. Below 1700 m no salinity records are available, and temperature has been recorded with a resolution of 8 mK. After offset correction here the accuracy may be better than 0.05 K. For all moorings the time series of low-pass filtered pressure records indicate strong mooring motion which undoubtedly influences strongly temperature and salinity records at least down to 1700 m. At this stage no attempt for correction has been made. Its influence on the rotor speed measured by Aanderaa current meters seems to be small. Assuming a worst case with a vertical elevation of 60 m (which is typically double the standard deviation of the non-filtered hourly pressure record) and back again within a semidiurnal tidal period at 5000 m nominal bottom distance one estimates less than 2 cm/s overspeeding of the rotor. In fact this worst case was never observed.

#### 2.1.2. High frequency analysis

For each record some statistical calculations are shown as print-outs, which are based on the total record length of unfiltered data at original sampling interval. For definitions and formulas used see Appendix 3.

Instead of time series frequency spectra of energy density are presented for non-filtered data. In order to distinguish between the diurnal tide and the

local inertial period, north and east components of the velocity vector are transformed to rotary components according to Willebrand et al. (1977), (see Appendix 2). The spectra were calculated by detrending pieces of 512 hours length, estimating spectral values for each piece, averaging in frequency range to result in not more than 20 estimates per decade and finally averaging over all pieces of the record. The frequency range thus is from 1/2 cph to 1/512 cph. 95% confidence intervals are included. Note that the spectra of the ACM-2 do not significantly differ from Aanderaa instruments at the same position and similar depths for frequencies below the "white noise" frequency of the latter.

#### 2.1.3. Low frequency analysis

According to the main aim of the research programme an attempt was made to extract very low frequency motions from the original signals. The original time series were low-pass filtered with a response of more than 98% for frequencies less 1/48 cph, 50% at about 1/30 cph and less than 2% for frequencies higher 1/24 cph. With these characteristics the cut-off range of the filter lies within the frequency range where the energy density spectra described in the foregoing section show the typical gap between inertial and mesoscale motion. For filter weights see Appendix 1. From the filtered data daily means were calculated, which then built the base for low-frequency statistics, progressive vector diagrams and time series plots.

## 2.2. XBT, SST and SSS

During METEOR 57/1, together with XBT-profiles sea surface temperature (SST) and salinity (SSS) were measured at the ship's hull using a continuously recording thermosalinograph on a course from the northern Bay of Biscay towards the Canaries and then to the Azores (trackline see figure 1). For control bucket temperature and salinity data were taken.

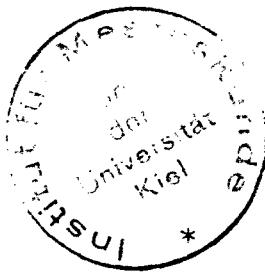

XBT-traces as well as SST and SSS-graphs were digitized manually. The profiles are shown in uncorrected form together with the control measurements and bottom topography.

## Acknowledgements

Thanks go to the crew of F.S. METEOR and to the IfM-data-processing group. The research program "Warmwassersphäre" (SFB 133) is supported by the Deutsche Forschungsgemeinschaft.

Graphical presentation: Overview (see also outfold)

The graphics are ordered according to moorings starting with N1, Oct 80 - Jul 81 followed by N1, Jul 81 - Mar 82, N11 and N12, followed by the sections.

For each mooring a table with details about the records precedes, followed by a sketch of the mooring design, statistics, high-frequency spectra, low-frequency statistics and time series plots.

**27 JUL 1981 - 2 MAR 1982**

NEADS site 1, 33° 05'N, 21° 53'W, 5290 m bottom depth

IfM mooring No 276200

Deployed: 27 Jul 1981, Meteor 57/1

Recovered: 02 Mar 1982, Meteor 60/3

Start of record: 28 Jul 1981, 0400Z.

End of record: 02 Mar 1982, 1200Z.

Recording interval: Aanderaa current meters: 60 min

Aanderaa thermistor chains: 120 min

Neil Brown acoustic current meter (ACM-2): 1 min

Time base check: ok with exceptions of short records and 276204

(4 cycles interpolated)

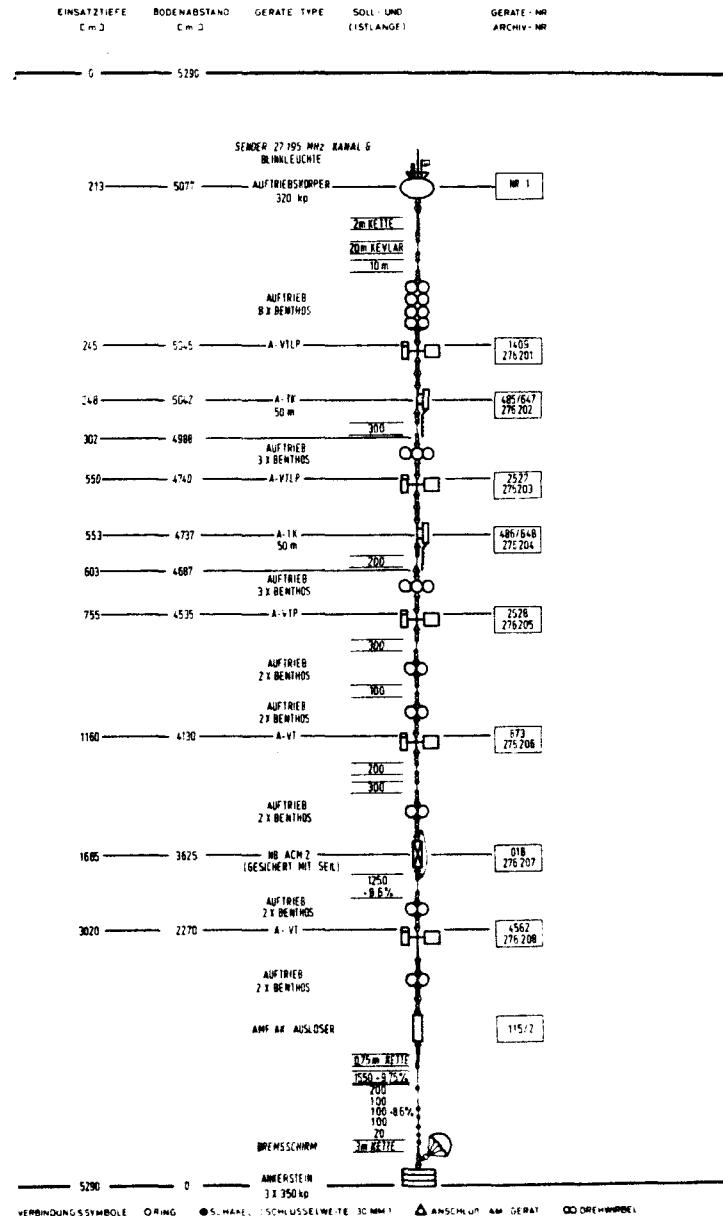

Parameters and

Corrections

N11

29 JUL 1981 - 7 MAR 1982

NEADS site 11,  $34^{\circ} 48'N$ ,  $23^{\circ} 05'W$ , 5155 m bottom depth

IfM mooring No 277200

Deployed: 29 Jul 1981, Meteor 57/1

Recovered: 07 Mar 1982, Meteor 60/3

Start of record: 29 Jul 1981, 2000Z.

End of record: 07 Mar 1982, 0600Z.

Recording interval: All instruments 60 min

Time base check: ok with exceptions

277205 and 277206, 1 cycle interpolated each

Parameters and

NEADS site 12 31° 00'N, 20° 30'W, 4850 m bottom depth

IfM mooring No 278 200

Deployed: 25 Jul 1981, Meteor 57/1

Recovered: 01 Mar 1982, Meteor 60/3

Start of record: 25 Jul 1981, 1400Z.

End of record: 01 Mar 1982, 1300Z.

Time base check: ok

# **SECTIONS**

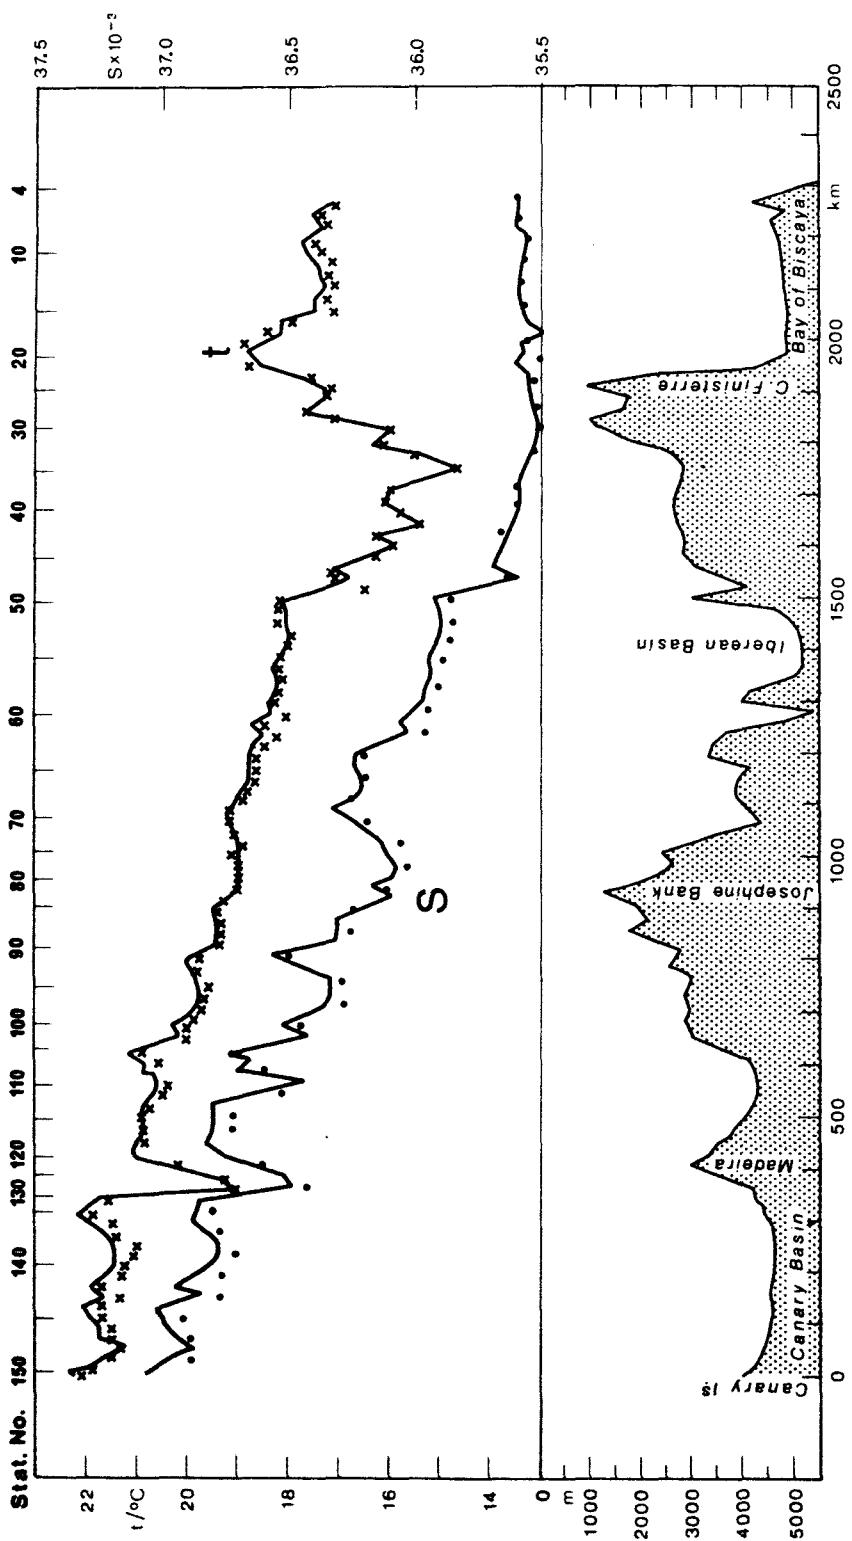

FIG. S1 TEMPERATURE AND SALINITY DISTRIBUTION AT THE SEA SURFACE (TOP) ON A SECTION CANARY ISLAND (LEFT) - BAY OF BISCAY (RIGHT). CROSSES AND DOTS INDICATE REFERENCE VALUES OBTAINED BY BUCKET TEMPERATURES AND SELECTED SALINOMETER CHECK VALUES. THE BATHYMETRIC PROFIL IS DEPICTED AT THE BOTTOM OF THE GRAPH.

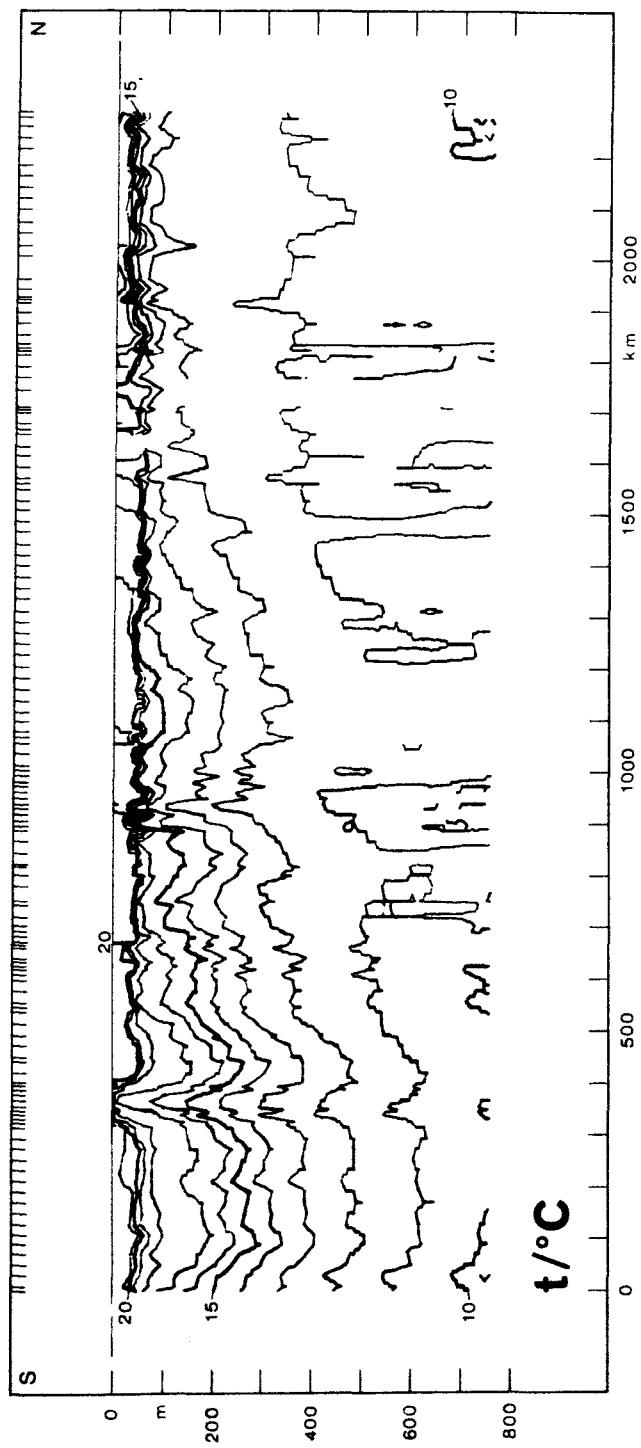

FIG. S2 VERTICAL TEMPERATURE DISTRIBUTION ON A XBT-SECTION, SIMULTANEOUSLY COLLECTED WITH SURFACE DATA IN FIG. S1. FOR DETAILS SEE TRACK LINE. DATA WERE GATHERED DURING METEOR-CRUISE 57/1 IN JULY 1981.

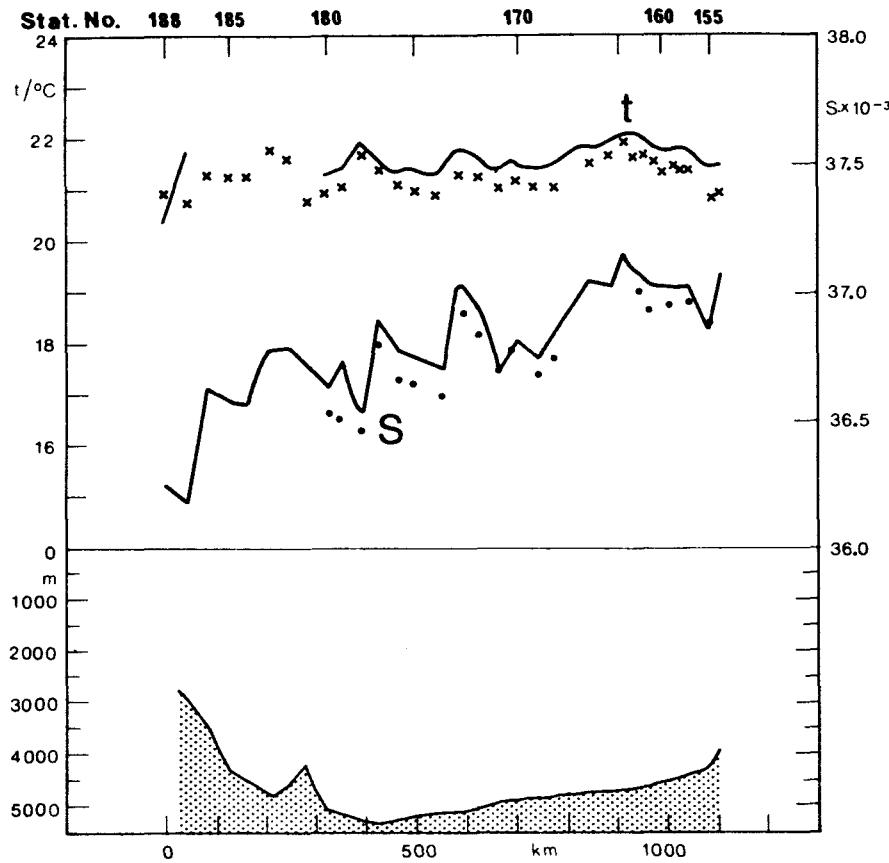

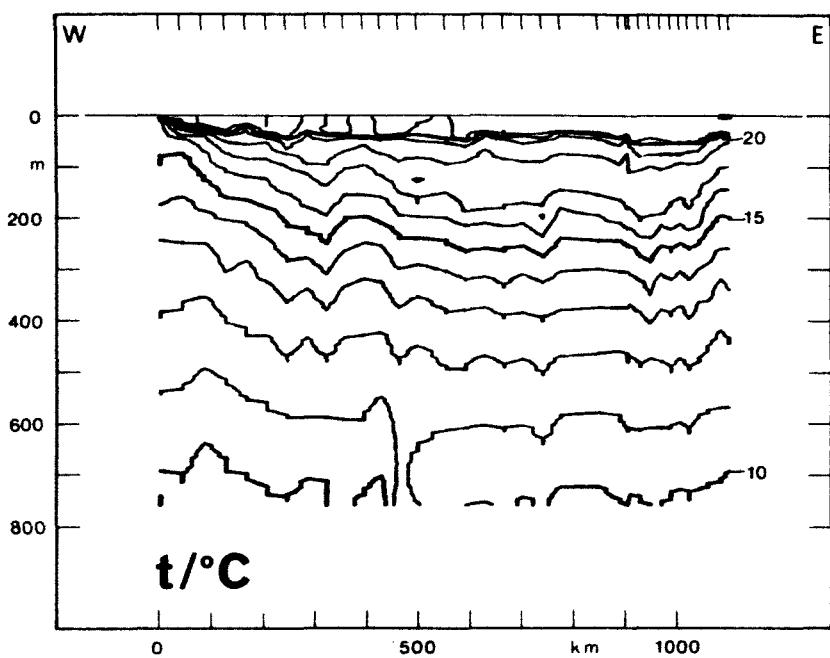

FIG. S3 TEMPERATURE AND SALINITY DISTRIBUTION AND BOTTOM TROPOGRAPHY  
ON THE AZORES (LEFT) - CANARY ISLAND (RIGHT) SECTION (TOP)  
TOGETHER WITH THE XBT INFERRED TEMPERATURE DISTRIBUTION (BOTTOM).  
FOR FURTHER EXPLANATIONS SEE TRACK LINE CHART AND FIG. S1 AND S2.  
NOTE THAT MOORING POSITIONS N11, N1 AND N12 WERE EQUALLY DISTRIBUTED  
ON THIS CROSS SECTION (JULY 1981, METEOR 57/I).

List of symbols

Press, P	Pressure (dbar)
Temp, T, t	Temperature (C)
Sal, S	Salinity ( $10^{-3}$ )
Sigt	Density parameter ( $\text{kg m}^{-3}$ )
UC, VC	East and North component of velocity vector (cm/s)
$u_+, u_-$	rotary components of velocity vector (cm/s), clock/anticlockwise
$  \vec{u}  $	current speed (cm/s)
$\phi$	current direction (TC north)

Appendix 1: Lanczos Taper:

The following filter weights have been used for low pass filtering:

$$w(i) = \frac{m}{\pi(i-1)} \sin\left(\frac{\pi(i-1)}{m}\right) i = 2, 3, \dots m; m = 67$$

Appendix 2: Rotary components

According to Willebrand et al. (1977) rotary components  $u_+$  and  $u_-$  may be defined by

$$u_{\pm} = \sqrt{1/2} (uc \pm i vc)$$

with uc and vc as East- and North-components of the velocity

vector and  $i = \sqrt{-1}$ . The autospectra  $E_+$  and  $E_-$  are related to the autospectra  $E_{uu}$  and  $E_{vv}$  and the quadrature spectrum  $Q_{uv}$  of the Cartesian components uc, vc by

$$E_{\pm}(\omega) = 1/2 (E_{uu}(\omega) + E_{vv}(\omega) \pm 2 Q_{uv}(\omega)); \omega > 0$$

### Appendix 3: Statistical Formulas
