*Dedicated to;*

*To my beloved parents,  
Mr.Arumugam & Mrs.Saraswathy*

*To my best sisters,  
Pathma & Keeli*

*To my supportive brothers and brother in law,  
Sugunanathan, Saravanan and Kumar*

*For all the love, care and support.....*

## ACKNOWLEDGEMENTS

With the blessing of God, I able to complete my Master in Civil Engineering successfully. First of all, I really was very grateful and would like to take this opportunity to say thank you very much to my supervisor P.M Ismail Yusof. Thank you for being my supervisor and not someone else. Thank you for all your enthusiastic guidance, numerous comments, criticisms, suggestions and insights for me during the whole 1 year of my Master Project. Not forgetting, P.M.Kemas Ahmad Zamhari, my co-supervisor who I consult and get guidance. All your support and kindness are really appreciated. With your much patience, availability and leading. I was able to complete this research, although many times you are loaded with heavy workloads.

My appreciation is also extended to all academic and non-academic members of the Faculty of Civil and Environmental Engineering, for their warm hearted cooperation in this research. My sincere appreciation also extends to all the staff of Highway Engineering Laboratory, UHTM, who provided assistance at various occasions. Their views and tips are useful indeed. Unfortunately, it is not possible to list all of them in this limited space.

I also wish to record my sincere appreciation to P.M.Haji Abd.Aziz Bin.Abd.Latiff, Prof.Dato'Haji Ismail Bin.Haji Bakar and Dr.Chan Chee Ming as the project seminar panels for providing me with comments and valuable suggestion to improve this research.

A heartfelt acknowledgement to my parents and family members for all your supports, encouragements and financial providences during my Master studies.

Last but not least, I want to express my appreciation to my fellow friend who helps me a lot in this project. Needless to say without all the above help and support, the writing and production of this project would not have been possible.

## ABSTRACT

Village and estate roads have failed to function due to damage at earlier stage of construction and this required frequent maintenance. Weak sub-grade is the basic factor of exponential damage. In order to overcome this problem, many procedures have been developed to improve the physical behavior (strength or stiffness) of the sub grade soil. One of the procedures is to incorporate a wide range of stabilizing agent, additives or conditioners. Silicon dioxide ( $\text{SiO}_2$ ) is a water based sodium silicate which is currently being patented on application by Probase Manufacturing Sdn.Bhd. to stabilize subgrade soils. The main objective of this research is to determine the resilient modulus of the liquid  $\text{SiO}_2$  stabilized sub grade soil at number of state conditions (i.e. density, moisture content and amount of stabilizer). Repeated triaxial load test was carried out at Highway Engineering Laboratory, UTHM. The specimens were prepared with maximum (100%), 90% and 95% dry density, optimum moisture content, 3% dry of optimum and 3% wet of optimum, and the amount of stabilizer was 4%, 8% and 12% of dry density of the soil. The specimens were cured for 0, 7, 14 and 28 days to determine the effect of curing days on the stabilized soil. The resilient modulus data were used to identify the best fit equation with the data. However typical pavement system analyzed using KENLAYER for non-linear elastic layer for fine grained soil; the equation applicable is the bilinear equation. Analysis of Variance (ANOVA) has been carried out to evaluate the level of significance effect of the state conditions on the stabilized soil. It has been found that density affects the resilient modulus of fine grained materials; however the magnitude of this effect is smaller compared to effect of moisture conditions. The addition of liquid  $\text{SiO}_2$  stabilizer improves the stiffness (resilient modulus) of the soil and consequently, the optimum concentration is found to be 4% for sub grade stabilization through this study.

## ABSTRAK

Jalan-jalan kampung dan ladang gagal berfungsi selepas pembinaan disebabkan oleh kerosakkan pada peringkat awal, maka penyelenggaraan kerap dilakukan bagi mengatasi masalah ini. Lapisan subgrade yang lemah menjadi punca utama berlakunya kerosakkan pada jalan raya. Bagi mengatasi masalah ini, pelbagai cara telah diperkenalkan, antaranya ialah aplikasi bahan penstabil, bahan tambah dan lain-lain lagi. Silicon dioksida ( $\text{SiO}_2$ ) merupakan bahan penstabil dalam bentuk cecair yang kini digunakan dalam proses penstabilan lapisan subgrade jalanraya yang diperkenalkan oleh Probase Manufacturing Sdn.Bhd. Objektif utama kajian ini ialah mengkaji modulus ketahanan tanah subgrade yang telah distabilkan dengan penstabil  $\text{SiO}_2$  pada beberapa keadaan (i.e. ketumpatan tanah, kandungan air dan jumlah penggunaan bahan penstabil) yang berlainan. Ujian *repeated triaxial load* telah dijalankan di Makmal Kejuruteraan Jalanraya, UTHM. Spesimen disediakan dengan ketumpatan maksimum (100%), 95%, 90%, kandungan air optimum, 3% kurang dari optimum, 3% lebih dari optimum, dan bahan penstabil sebanyak 4%, 8% dan 12% dari berat kering tanah. Kesemua spesimen telah diawet selama 0, 7, 14 dan 28 hari untuk mengkaji kesan tempoh pengawetan terhadap tanah yang telah distabilkan dengan  $\text{SiO}_2$ . Data modulus ketahanan digunakan untuk menentukan persamaan konstitutif yang mempunyai penyuaiian terbaik dengan data tersebut. Sistem jalanraya dianalisis menggunakan KENLAYER untuk lapisan kenyal yang tidak linear untuk tanah subgrade, tetapi hanya persamaan bilinear diaplikasi dalam sistem KENLAYER bagi tanah subgrade. Analisis of Variance (ANOVA) telah dijalankan bagi mengkaji kepentingan beberapa keadaan (i.e. ketumpatan tanah, kandungan air dan jumlah penggunaan bahan penstabil) atas tanah yang telah distabil. Melalui kajian ini, didapati ketumpatan tanah mempunyai kesan yang kecil terhadap tanah yang telah distabilkan jika dibandingkan dengan kandungan air. Penstabilan dengan

bahan penstabil  $\text{SiO}_2$  meningkatkan kekerasan (modulus ketahanan) tanah subgrade, dan kepekatan optimum yang dikenalpasti melalui kajian ini ialah sebanyak 4%.

## CHAPTER I

### INTRODUCTION

#### 1.1 Introduction

Village roads and estate roads were vital components in the national road system. This road system has functioned as the source of transportation to transfer agricultural products from the farm or estates to the urban areas, where it is processed and sold. These road networks were important transportation mode and are regarded as an essential source for the development of rural areas.

According to Yoder (1995), “in most cases, the roads are used more than its capacity. This is due to lack of systematic and comprehensive maintenance. As the damage occurs at a very early stage, it affects the functionality of the village and estate roads. The damage occurs at faster rate whenever high numbers of heavy vehicles use the road frequently. The repercussion is that the roads do not function to the maximum years it was designed to last.”
