BORANG PENGESAHAN STATUS TESIS♦

JUDUL: A SWITCHED-BEAM ANTENNA FOR CELLULAR COMMUNICATION

SESI PENGAJIAN: 2002/2003

Saya NORSUHAIDA BINTI AHMAD
(HURUF BESAR)

mengaku membenarkan tesis (Sarjana Muda/Sarjana /Doktor Falsafah)* ini disimpan di Perpustakaan dengan syarat-syarat kegunaan seperti berikut:

1. Tesis adalah hakmilik Kolej Universiti Teknologi Tun Hussein Onn.
2. Perpustakaan dibenarkan membuat salinan untuk tujuan pengajian sahaja.
3. Perpustakaan dibenarkan membuat salinan tesis ini sebagai bahan pertukaran antara institusi pengajian tinggi.
4. **Sila tandakan (✓)

☐	SULIT	(Mengandungi maklumat yang berdarjah keselamatan atau kepentingan Malaysia seperti yang termaktub di dalam AKTA RAHSIA RASMI 1972)
☐	TERHAD	(Mengandungi maklumat TERHAD yang telah ditentukan oleh organisasi/badan di mana penyelidikan dijalankan)
☑	TIDAK TERHAD	

Disahkan oleh

Special to my beloved mum and late daddy,

Dad,

You always have a special place in my heart forever and ever after.

(Al-Fatihah)

Mum,

Thanks for praying and wish for my success. Your love makes me strong and confident where ever I go, in what ever I do.

To my fiancé,

You meant everything to me,

ACKNOWLEDMENTS

Praise be to Allah the lord of the worlds and universe, with His consent I was able to complete this study.

Special thanks to my supervisor, PM Dr Zainal Alam Bin Haron and my co-supervisor, Professor Dr Tharek Bin Abdul Rahman for giving me invaluable guidance, advice and support throughout the study. I would also like to thank Mr Mazlan, Mr Rosman, Mr Azwan, Mr Adni snd all Post Graduate Center's staff (PPS) who have lent their helping hands to make this study success. Thanks also to all my friends who have shared my happiness and constraint.

I would like to dedicate this work to my late daddy, Tuan Hj Ahmad Bin Dahaman (who passed away fifty six months ago – May Allah bestow Rahmah upon him) and my mum, Puan Hajjah Romlah Binti Md Akib,who has strived hard to ensure every child of hers goes to school. I would also like to dedicate this work to my family especially Kak Ton, Kak Nie, Chik, Kak Na, Abg Non, Abg Chik and Adik Fuziah for their sacrifices and patience. To my fiancé, Mr. Anizan Bin Mahat, thanks for being my backbone all the time.

THANK YOU

ABSTRACT

Wireless communication has created a continuing demand for increased bandwidth and better quality of services. Smart antenna arrays are one of the ways to accommodate this demand which can provide numerous benefits to service provider and the customer. Switched-beam antenna was chosen for this project due to its easier implementation and lower cost compared to adaptive array. Switched-beam antenna is one of smart antenna technique which comprises a number of predefined beams. The control system switches among the beams that provide the maximum signal response. Through the investigation and study on this system, found that, the 120° sectorization with three monopole antenna elements suited for prototype construction. The initial stage to design this system is by using MATLAB simulation to identify the antenna characteristic and the parameters involved. The second stage is about the construction of the prototype switched-beam antenna used to measure the antenna gain and relative power level which displayed using CASSY program.

ABSTRAK

Komunikasi tanpa wayar telah mencetuskan permintaan yang berterusan bagi meningkatkan lebar jalur serta perkhidmatan yang lebih berkualiti. Tatasusunan antena terbaik merupakan cara paling tepat untuk memenuhi permintaan ini kerana ianya menyediakan pelbagai faedah kepada pengeluar dan pengguna. Antena pensuisan alur telah dipilih untuk projek sarjana kerana senang dibina dan memerlukan kos yang rendah berbanding antena tatasusunan penyesuai. Antena pensuisan alur merupakan salah satu teknik antenna terbaik yang menggandingkan beberapa alur yang telah dikenalpasti. Suis sistem kawalan bertindak untuk memilih isyarat yang memberikan sambutan paling maksima. Berdasarkan kajian mengenai system ini, didapati bahawa, pensektoran 120° menggunakan tiga antena monopol adalah memenuhi kehendak binaan prototaip. Peringkat permulaan rekabentuk bagi sistem ini adalah menggunakan simulasi MATLAB untuk mengenalpasti ciri-ciri antena dan parameter-parameter yang terlibat. Peringkat kedua adalah mengenai binaan prototaip antena pensuisan alur untuk digunakan bagi mengukur gandaan dan aras kuasa yang boleh dipaparkan menerusi layar komputer menerusi aturcara CASSY.

CHAPTER I

INTRODUCTION

1.1 Introduction

Initially, the ability to communicate with people on move has evolved remarkably since 1897. Started from that, the new wireless communications methods and services have been enthusiastically adopted by people throughout the world.

The wireless communications industry is growing at explosive rate and is projected to reach 100 billion dollars of annual activity by the end of the year 2000. Consumers are continuously pressing system providers to expand their suite of services and provide these services at ever-decreasing costs. This ever-growing demand for mobile communications is constantly increasing the need for better coverage, improved capacity and higher quality service.

Smart antenna is the solution for the demands, which can give the service to the higher number of users with the minimum of spectrum requirements. The basic principle behind smart antenna is to control or reduce interference.

Smart antenna is dividing into two types. The first one is switched-beam antenna systems and another one is adaptive antenna systems. Figure 1.1 shows both of the mentioned antenna systems.

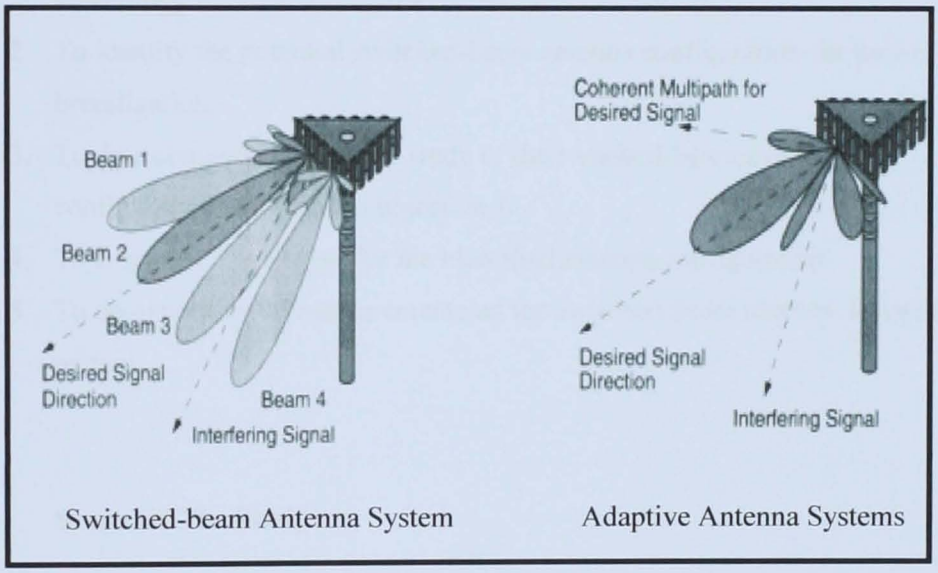

Figure 1.1: Types of antenna systems

Switched-beam system can select one of several beams to enhance receive signal. Adaptive antenna can adjust its antenna pattern to enhance the desired signal, null or reduce interference and collect correlated multipath power.

1.2 Aim Of Project

The aim of this project is to investigate a potential switched-beam antenna configuration for use in mobile communications.

The project objectives are as follows: -

1. To be familiar with the current state of the art in switched-beam antenna technology.
2. To identify the potential switched-beam antenna configuration for further investigation.
3. To do a computer simulation study of the switched-beam antenna configuration identified in objective 2.
4. To construct a prototype for the identified antenna configuration.
5. To do experimental measurements on the switched-beam antenna radiation pattern.

1.3 Scope Of The Study

This project will only be concerned with the design, construction and testing of the identified switched-beam antenna configuration. It will not be concerned with other potential structures. A three beams smart antenna system is proposed for this project with the 120° sectorization.

This project used three monopole antennas in the experiment based on its characteristics. The most important things are to be familiar with the switching techniques by using the simple switches.
