Martin
Gainville³,
Michel Pons⁴

Sequential Modular Simulation

X^0 : Temperature T , Pressure P , Composition z and total flowrate Q

d : operating and design parameters of the modules are the standard input of a pure simulation case

Pressure-driven Simulation

Characterize Oil and Gas upstream operations

For example, pipes connected to the same manifold must operate at the same pressure

n_w Pressure Equality Constraints

Michel Pons⁴

Pressure-driven problem is a particular case of design problem

Variables associated to pressure constraints are

- the well flowrates
- other variables

Two types of problem are treated :

- **Flowrates/Pressure problems**
 - Well flowrates and riser top pressure are known
 - Action variables are chokes openings or well pressures
- **Pressures/Pressure problems**
 - Well pressures and riser top pressure are known
 - Action variables are well flowrates

Without recycle

With recycle

FP Problem :

- Specification on the pressure at riser top
- Well pressures, flowrates and temperature are fixed (base case)
- Action variables : 5 pressure drops of the 5 chokes
- *Quasi-Newton* Strategy used
- Results obtained in 4 iterations and 11 flowsheet simulations, for 15 bar

5 Pressure Drops *versus* Riser top pressure specification
