## Inhaltsverzeichnis zum fünfunddreißigsten Band

Important Publisher's Notice / Wichtiger Hinweis des Verlages . . . . . before page 637

### Review Article / Review-Artikel

ACKERMANN, M.: The Construction, Selection, Characterization, and Application of Recombinant Herpes Viruses . . . . .	379
AHNE, W.: Virusinfektion aquatischer Organismen. (Viral infections of aquatic organisms) . . . .	493
BAUER, C.: Anthelminthikaresistenzen bei Nematoden von Rind, Schaf und Ziege. (Anthelmintic resistance in nematodes of cattle, sheep and goats) . . . . .	286
BERGLER, R.: Die Psychologie der Beziehungen von Heimtieren, Heimtierhaltern und Tierärzten. (The psychology of the relations between pets, pet-owners and veterinarians) . . . . .	443
BÖHNEL, H.: Die Toxine der Clostridien. (The Toxins of Clostridia) . . . . .	29
FÖLSCH, D. W., see HAUSER and FÖLSCH . . . . .	579
HAUSER, R. H., and D. W. FÖLSCH: Methods for Measuring Atmospheric Dust, Micro-Organisms and Ammonia in Poultry Houses: Review and Approved Practices . . . . .	579

### Original Papers / Originalarbeiten

ABAAS, S., see ELSHEIKH, KARLSSON, BERGMAN and ABAAS . . . . .	256
AHMED, J. S., K. LENDNER, S. STEUBER, E. REINWALD, and F. HÖRCHNER: <i>In vitro</i> Stimulation of Pony Peripheral Blood Lymphocytes by a Soluble Fraction of <i>Trypanosoma evansi</i> . . . . .	462
ALI-VEHMAS, T., see KAARTINEN, ALI-VEHMAS, LARSEN, JENSEN and SANDHOLM . . . . .	77
ALI-VEHMAS, T., see also KAARTINEN, ALI-VEHMAS, LARSEN, JENSEN and SANDHOLM . . . . .	681
ALI-VEHMAS, T., see also SANDHOLM, ALI-VEHMAS, KAARTINEN and JUNNILA . . . . .	346
ALTANER, C., V. ALTANEROVA, J. BAN, V. JANIK, V. VOLEJNICEK, Z. FRAJS, and L. CERNY: Cell-Derived Vaccine Against Bovine Leukaemia Virus Infection . . . . .	736
ALTANEROVA, V., see ALTANER, ALTANEROVA, BAN, JANIK, VOLEJNICEK, FRAJS and CERNY . . . .	736
ANNAN-PRAH, A., and M. JANC: The Mode of Spread of <i>Campylobacter jejuni/coli</i> to Broiler Flocks . . . . .	11
ANTAL, T., I. SZABÓ, VALENTINA ANTAL, G. VAJDA, A. POLNER, B. TOTTH, I. SZOLLÁR, and L. STIPKOVITS: Respiratory Disease of Horses Associated with Mycoplasma Infection . . . .	264
ANTAL, T., see also STIPKOVITS, VAJDA, ANTAL, ANTAL and SZABO . . . . .	197
ANTAL, V., see ANTAL, SZABÓ, ANTAL, VAJDA, POLNER, TOTTH, SZOLLÁR and STIPKOVITS . . . .	264
ANTAL, V., see also STIPKOVITS, VAJDA, ANTAL, ANTAL and SZABÓ . . . . .	197
ASKAA, J., see BIELEFELDT OHMANN, BLOCH, DAVIS and ASKAA . . . . .	477
ÅSTRÖM, G., see SAAD and ÅSTRÖM . . . . .	654
BALJER, G., see WASTLHUBER, BALJER, DAIMON, HÜBERT und MAYR . . . . .	218
BAN, J., see ALTANER, ALTANEROVA, BAN, JANIK, VOLEJNICEK, FRAJS and CERNY . . . . .	736
BAUER, J., see BÜTTNER and BAUER . . . . .	421
BELAK, S., see MERZA, BELAK and MOREIN . . . . .	695
BERGMAN, R., see ELSHEIKH, KARLSSON, BERGMAN and ABAAS . . . . .	256
BERNORTH, E.-M., and K. H. BÖHM: Serological Comparison Between Isolated Strains of <i>Aeromonas salmonicida</i> by Agglutination and Enzyme-Linked Immunosorbent Assay (ELISA) . . . . .	637
BERNSTEIN, M., see ELAD, YERUHAM and BERNSTEIN . . . . .	431
BETTI, F., and R. MARÇAL: Monocyte-Macrophages Increase in the Bursal Follicular Medulla Following Bacterial Intraoalacal Inoculation of <i>Bordetella pertussis</i> in Chicks . . . . .	704
BIELEFELDT OHMANN, H., B. BLOCH, W. C. DAVIS, and J. ASKAA: BVD-Virus Infection in Peripheral Blood Mononuclear Cells from Persistently Viraemic Calves Studied by Correlative Immunoelectron Microscopy . . . . .	477

BISPING, W., see WITTENBRINK, HORCHLER und BISPING	237
BITAY, Z., see IVANICS, GLÁVITS, TAKÁCS, MOLNÁR, BITAY and MEDER	368
BLOCH, B., see BIELEFELDT OHMANN, BLOCH, DAVIS and ASKAA	477
BÖHM, K. H., see BERNOTH and BÖHM	637
BOZZANO, A. J., see CIUCHINI, BOZZANO, PESTALOZZA and TOLLIS	677
v. BÜLOW, V.: Unsatisfactory Sensitivity and Specificity of Indirect Immunofluorescence Tests for the Presence or Absence of Antibodies to Chicken Anaemia Agent (CAA) in Sera of SPF and Broiler Breeder Chickens	594
BUONAVOGLIA, C., L. DI TRANI, F. GRAMENZI, R. ZOLETTO, R. LELLI, and M. SCACCHIA: Duration of Immunity in Swine Inoculated with a Monovalent Foot-and-Mouth Disease Oil Emulsion Vaccine	397
BUONAVOGLIA, L., see also TOLLIS, BUONAVOGLIA, DI TRANI and VIGNOLO	504
BÜRKI, F., see MÖSTL and BÜRKI	186
BUSCHMANN, H., and A. KLEINSCHMIDT: The Effect of Radiation on the Peripheral Lymphocyte Subpopulations in Swine	230
BÜTTNER, M., and J. BAUER: The Effects of Dietary T-2 Toxin on the NK-Cell Activity and on the Reactivation of Pseudorabies Virus in NMRI Mice	421
CASAS, S., see ZAROR y CASAS	204
CERNY, L., see ALTANER, ALTANEROVA, BAN, JANIK, VOLEJNICEK, FRAJS and CERNY	736
CHARLIER, G., see COX, CHARLIER and HOUVENAGHEL	317

#### Summary

Coronaviruses antigenetically related to bovine coronaviruses and human coronavirus strain OC43 were detected in fecal samples from two primates (moor macaque and a chimpanzee) by electron-microscopy and ELISA. This ELISA is specific for coronaviruses belonging to the antigenic group 2. Attempts to propagate the primate coronaviruses in cell culture or suckling mouse brain failed.

Key words: Coronavirus, primates, ELISA, antigenic relationship

Coronaviruses have been isolated from a variety of mammalian and avian species. They are known to have pathogenic potential and one of the disease entities caused by these viruses is diarrhea as observed in calves, piglets, dogs, cats, horses, turkeys and other species (WEGE et al., 1982). Mammalian coronaviruses have been divided into at least two antigenic groups (PEDERSEN et al., 1978). Porcine epidemic diarrhea virus (PEDV) is antigenically unrelated to these groups. Additionally, coronavirus-like particles have been demonstrated in diarrheal stool samples from humans (CAUL et al., 1975; BATTAGLIA et al., 1987). There are only a few reports on the propagation of these particles in organ cultures or cell lines (CAUL and EGGLESTONE, 1977; LAPORTE and BOBULESCO, 1981). Polypeptides of particules purified from stools have been shown to be related to polypeptides of the human coronavirus strain OC-43 (BATTAGLIA et al., 1987) indicating that they are members of the family coronaviridae and related to human respiratory coronaviruses. In primate species enteric coronavirus-like particles have been detected by electron microscopy (CAUL and EGGLESTONE, 1979; SMITH et al., 1982), but no attempt has been made to

Fig. 1. Negatively stained preparation of a fecal sample from a moor macaque (*Macaca maura*). The particle is of typical coronavirus morphology, but details of the projections can not be defined. Bar represents 100 nm

demonstrate antigenetic relationships to established coronaviruses. Therefore the nature of these particles remains unclear.

Recently, fecal samples from two primates which sequentially suffered from acute diarrhea and finally died were sent to our laboratory. Both animals had been kept in a zoological garden in South Germany. The first case was a moor macaque (*Macaca maura*) about one and a half years old. The animal had been brought in from another zoo about two weeks before. The second animal was a chimpanzee aged about 37 years. This animal was housed in the neighbourhood of the first and died with diarrhea about two months later.

Fecal samples were routinely processed for virological diagnosis, i. e. diluted about 1:5 in PBS, thoroughly suspended in a Labblender (Seward Lab, London), and centrifuged. Supernatants were assayed by ELISA specific for rotavirus (BACHMANN, 1979) or coronaviruses (antigenic group 2; CZERNY and EICHHORN, in preparation) or negatively stained and examined by electron microscopy. By EM, coronavirus-like particles were easily detected. Additionally, particles with typical coronavirus morphology were detected less frequently (Fig. 1). The size range of these particles was about 90–160 nm. Surface projections were clearly visible (about 18–25 nm) but details of their shape could hardly be distinguished. This morphological injury may be due to the time elapsed between the death of the animal and the arrival of the samples in the laboratory ("Waterloo station effect", REYNOLDS et al., 1984). No other viruses were detected by EM.

Both samples scored negative in the polyclonal rotavirus-ELISA. On the other hand, in the coronavirus-ELISA both samples scored clearly positive. This assay is based on a mixture of two monoclonal antibodies generated against the bovine coronavirus strain Munich V 270/84. They recognize different epitopes (determined by competition ELISA) and serve as catching antibodies. Rabbit hyperimmune serum is used as detecting antibody in an indirect assay. The assay proved to be highly specific for bovine coronaviruses (BCV) and human coronavirus strain OC-43. Reaction patterns of these viruses are nearly

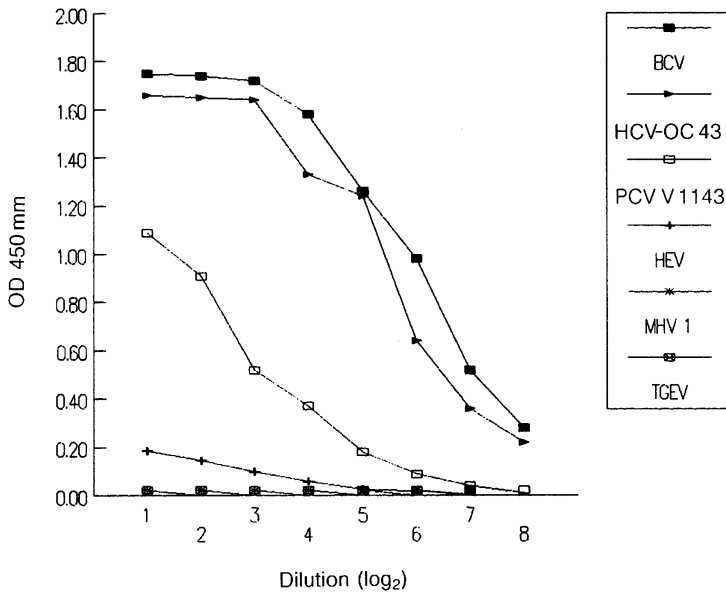

Fig. 2. Optical densities obtained with different coronaviruses assayed in a monoclonal antibody based ELISA. Bovine coronavirus (BCV) and human coronavirus strain OC 43 (HCV-OC 43) react identically. The reaction pattern of the primate coronavirus (PCV V 1143) is similar, although lower extinctions are observed. Reactivity of porcine hemagglutinating encephalomyelitis virus (HEV) is strikingly different. Coronaviruses of the antigenic group 1, like porcine transmissible gastroenteritis (TGEV) or mouse hepatitis viruses (MHV) do not react at all

identical (Fig. 2). Other members of the coronavirus antigenic group 2 react with minor intensity. Members of the other antigenic groups of the family coronaviridae do not react at all. Fecal samples from primates gave similar reaction patterns in this assay (Fig. 2). The patterns were similar to BCV and HCV OC-43 although the extinctions obtained were clearly lower. This may be due to proteolytic damage that occurred before the material could be assayed. On the other hand, this behaviour may also be explained by minor antigenic differences of epitopes recognized by ELISA between primate coronaviruses and BCV or HCV OC-43. Nevertheless, the results clearly indicate that the particles observed by EM are viruses to be classified within the family coronaviridae.

Propagation of the primate coronaviruses was attempted in Vero-cells, human embryonic lung cells and additionally in secondary bovine embryonic lung cells. Samples were inoculated both with or without the addition of trypsin (2.5 µg/ml).

Cultures were observed daily for cpE and passaged after 7 days. In the course of three passages no cpE was evident. Examination of freeze-thawed cell cultures by ELISA and EM proved to be negative during all passages.

Additionally, suckling mice (Balb/c, 2–3 days old) were inoculated i. c. with fecal supernatants and observed daily. No disorders were observed over the next 10 days. Passage in suckling mouse brains was negative as was examination of brain suspensions by ELISA and EM.

The failure to propagate the strains in cell cultures or suckling mouse brain probably results from destruction of infectivity during transport and other manipulations. This is in agreement with the observation of only a small percentage of complete particles with coronaviral morphology in feces.

The pathogenic potential of coronaviruses of primates remains unclear, although both animals had suffered from diarrhea. However, in the first animal a number of bacterial pathogens (salmonella enteritidis, beta-hemolysing streptococci and staphylococci) were

identified. The second animal did not only show diarrhea, but suffered a general breakdown of the organism, probably due to its age.

The use of the monoclonal antibody-based ELISA which is specific for antigens of BCV, HCV OC-43 and obviously primate coronaviruses, may give more insight into the prevalence, epidemiology, and pathogenicity of these viruses.

### Acknowledgements

We thank SHEILA SCOTT for her help in preparing the manuscript and MONIKA HEILMANN for her technical assistance. This work was supported in part by the German Federal Ministry of Youth, Family, Women and Health.

### Zusammenfassung Enterale Coronaviren bei Primaten

In Kotproben von zwei Primaten (Moormakake und Schimpanse) wurden im Elektronenmikroskop sowie im ELISA Coronaviren nachgewiesen, die antigenetisch mit bovinen Coronaviren und dem humanen Coronavirus Stamm OC-43 verwandt sind. Der verwendete ELISA ist spezifisch für Coronaviren der Antigen-Gruppe 2. Versuche, die Primaten-Coronaviren in Zellkulturen oder Babymäusen zu vermehren, schlugen fehl.
