CONTENTS

Preface *xiii*

SECTION I: BASIC ASPECTS OF SHOCK WAVE LITHOTRIPSY

- 1 / Influence of Output Setting on Acoustic Field of a Shock Wave Lithotripter 1
by A.J. Coleman, M.J. Choi, and J.E. Saunders
- 2 / In Vitro Fragmentation of Gallstones 7
by T. Sauerbruch, M. Neubrand, and H. Lobentanzler
- 3 / In Vitro Fragmentation of Gallstones: A Comparison of Three Different Shock Wave Principles 15
by H.Th. Schneider, R. Ott, P. Janowitz, W. Swobodnik, H. Neuhaus, and Ch. Ell
- 4 / Analysis of Shock Wave Destruction of Stones by High-Speed Films and Microscopy 17
by W. Sass, M. Bräunlich, M. Hayler, E. Matura, W. Folberth, S. Kettermann, J. Seifert
- 5 / Effect of Shock Waves on Gallstones and Materials 27
by M. Delius and S. Gambihler

SECTION II: SHOCK WAVE TREATMENT OF GALLBLADDER STONES

- 6 / Gallbladder Lithotripsy: Evaluation of Clinical Results 35
by G. Paumgartner
- 7 / Electromagnetic Cholecystolithotripsy 39
by H.J. Burhenne, J.S. Fache, B. Rawat, and S.H. Lee
- 8 / Piezoceramic Lithotripsy: Clinical Results 43
by Ch. Ell, H.Th. Schneider, J. Benninger, and R. Braun
- 9 / Electrohydraulic Lithotripsy of Radiolucent Gallbladder Calculi 49
by M. Sackmann
- 10 / Targeting and Fragmentation 59
by W.E. Torres and B.R. Baumgartner
- 11 / Analgesia for Biliary Lithotripsy 69
by G. Schelling, W. Weber, G. Mendl, J. Pauletzki, and M. Sackmann

- 12 / Piezoelectric Lithotripsy for Gallstones: Results of the First Hundred Patients Treated in Dublin 73
by A. Darzi, W.A. Tanner, F.B.V. Keane
- 13 / Influence of Shock Wave Source on the Effects of Biliary Lithotripsy 81
by M. Staritz, A. Große, and A. Rambow
- 14 / Biliary Pain After Extracorporeal Shock Wave Lithotripsy: Effect of Ursodeoxycholic Acid and Stone Fragments 87
by R.W. Summers, J. Wilkie, J.W. Maher, and T. Dean
- 15 / Contribution of Ursodeoxycholic Acid to Extracorporeal Shock Wave Lithotripsy of Gallbladder Stones 93
by L.J. Schoenfield
- 16 / Gallstone Lithotripsy With or Without Bile Acid Therapy 97
by A. Darzi, W.A. Tanner, and F.B.V. Keane
- 17 / Are Bile Salts Necessary With Gallstone Lithotripsy? An Interim Report 103
by B. Ross, J.P. Nicholl, B.T. Williams, and A.G. Johnson
- 18 / Dissolution Therapy Is Necessary After Lithotripsy of Gallbladder Stones by Shock Waves 109
by V. Kordac, J. Benes, J. Chmel, M. Kaláb, and C. Stuka
- 19 / Early Results of Combined Electrohydraulic Shock Wave Lithotripsy and Oral Litholytic Therapy of Gallbladder Stones at the University of Iowa 113
by J.W. Maher, R.W. Summers, T.R. Dean, J. Swift, D. Heitshusen, and G. Quinn
- 20 / Rapid Dissolution of Gallstone Fragments After High Doses of the Combination of Ursodeoxycholic Acid and Chenodeoxycholic Acid Plus Early Shock Wave Retreatment: A Comparison With Chenodeoxycholic Acid 119
by M. Uribe, J.M. Sánchez, B. Dávila, N. Méndez, A. Merikanski, and F. Bosques

SECTION III: INTERVENTIONAL TECHNIQUES FOR GALLBLADDER STONES

- 21 / Interventional Gallbladder Procedures 125
by E. vanSonnenberg
- 22 / Organic Solvents for Contact Dissolution of Cholesterol Gallstones 129
by A.F. Hofmann, C.D. Scheingart, O. Esch, J. Lillienau, J.C. Spinosa, E. vanSonnenberg, H.B. D'Agostino, R. Akimoto, A.R. Mossa, H. Erik Wahlstrom, John J. Hajjar, and S.F. Zakko
- 23 / Results of Stone Dissolution by Methyl-*tert*-Butyl Ether 137
by J.L. Thistle, B.T. Petersen, C.E. Bender, and A.J. LeRoy
- 24 / Combination of Extracorporeal Shock Wave Lithotripsy and Dissolution of Gallbladder Stones by Methyl-*tert*-Butyl Ether 143
by M. Neubrand, J. Holl, T. Sauerbruch, M. Sackmann, J. Pauletzki, and G. Paumgartner
- 25 / Direct Contact Treatment of Gallbladder Stones: Retrograde Access to the Gallbladder 147
by E.Ch. Foerster and W. Domschke
- 26 / Rotary Gallstone Lithotripsy: Follow-up in 19 Patients 155
by F.J. Miller, R.L. Gordon, and C. Cope
- 27 / Laser Lithotripsy of Gallstones 159
by F.W. Schildberg

Cholesterol Nucleation Time: A Potentially Valuable Parameter for Prediction of Gallstone Recurrence After Successful Dissolution Therapy

Dieter Jüngst
Thomas Lang
Gustav Paumgartner

Previous studies suggest that at least 30% to 50% of patients with complete gallstone dissolution by oral bile acid therapy will develop recurrent stones over a 3- to 5-year period when bile acid treatment is withdrawn.^{5, 6} Villanova et al.⁹ have demonstrated that patients who had multiple gallstones seem to be at greater risk of recurrence after successful stone dissolution than those who originally had solitary stones.

Abnormally rapid nucleation of cholesterol from supersaturated gallbladder bile is of key importance in primary gallstone formation and might therefore be a major determinant of gallstone recurrence.^{3, 6, 7}

It seemed possible that different cholesterol nucleation times or nucleation-promoting activity in the gallbladder bile of patients with multiple stones as compared with those with solitary stones might be responsible for the different rates of stone recurrence.

This is supported by earlier observations of Gollish et al.,¹ who reported a shortened nucleation time in all patients with multiple gallbladder stones while half of their patients with solitary stones (four of eight patients) needed more than 4 days to develop cholesterol crystals. More recently, van Erpecum et al.⁸ also found rapid nucleation in bile from patients with multiple gallstones but normal nucleation in most

gallbladder bile from patients with a single stone.

Groen et al.² have isolated, by concanavalin A-sepharose chromatography of gallbladder bile, a glucose/mannose-containing, 130 kilodalton (kD) glycoprotein with strong cholesterol nucleation-promoting activity in model bile. The activity was found in the majority of gallbladder bile investigated, and high nucleation-promoting activity titers were observed in bile from patients with multiple cholesterol stones. The activity titer in bile was not correlated to the total protein content, cholesterol saturation index, and total lipid concentration. The data of Groen et al.² are of particular interest and the relationship between the 130 kD glycoprotein and the pathogenesis of multiple cholesterol gallstones seems to be evident.

We have recently compared cholesterol nucleation times in the gallbladder bile of 59 patients with solitary and 42 patients with multiple gallstones.⁴ A clear separation was observed between two groups, one with pigment and mixed and the other with cholesterol stones (Fig 41-1). The results of the median cholesterol nucleation time in the gallbladder bile of these patients are illustrated (Fig 41-1). Long nucleation times exceeding 21 days were usually observed in bile from patients with pigment or

Fig 41-1.

Median cholesterol nucleation time in the gallbladder bile from 59 patients with solitary and 42 patients with multiple stones.

mixed stones, while abnormal nucleation was seen mostly in the bile of patients with cholesterol stones. However, nucleation times were significantly longer in bile from solitary than in bile from multiple cholesterol stone carriers. Only 1 of 32 patients with multiple stones as compared with 10 of 54 patients with a single stone had a normal nucleation time (>4 days). Furthermore, over a wide range of cutoff levels for cholesterol nucleation times the percentage of patients with abnormal nucleation in their gallbladder bile was consistently higher in patients with multiple than in patients with solitary stones. At a cutoff level of 4 days abnormal nucleation in gallbladder bile occurred in 80% of patients with solitary and in about 95% of patients with multiple stones. This is far above the known rate of stone recurrence in those patients. However, highly abnormal nucleation below 1 day was observed in 40% of patients with solitary and 55% of patients with multiple cholesterol stones. These rates are comparable to the percentage of long-term stone recurrence in those patients.⁹

Rapid nucleation of cholesterol in gallbladder

bile may predispose to gallstone recurrence in patients with cholesterol gallstones. The value of cholesterol nucleation times in the prediction of gallstone recurrence could be proved by follow-up of patients with successful stone dissolution in whom sampling of gallbladder bile prior to therapy has been possible.

Acknowledgment

We thank Benedikta Zündt for her excellent technical assistance and her help in preparation of the manuscript.
