#### Abstract

The $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$-catalyzed [2+2+2] cyclotrimerization of alkynes has been achieved. The reaction can be widely used for various alkynes and provides tri- or hexa-substituited benzenes regioselectively in high yields. The [2+2+2] cycloaddition of diynes and alkynes is also developed, and it affords benzene derivatives in moderate to high yields.

Keywords: Rh/amine catalyst; Cyclotrimerization; Hexa-substituted benzene.

## 1. Introduction

The transition metal-catalyzed [2+2+2] cyclotrimerization of alkynes has been well known as a useful method for the construction of hexa-substituted benzenes in a one-step. ${ }^{1-9}$ Since the first discovery by Reppe and co-workers, ${ }^{10}$ various transition metals ( $\mathrm{Ni},{ }^{2}$ $\mathrm{Rh},{ }^{3} \mathrm{Pd},{ }^{4} \mathrm{Ru},{ }^{5} \mathrm{Co},{ }^{6} \mathrm{Ti},{ }^{7}$ and $\mathrm{Mo}^{8}$ ) catalyzed $[2+2+2]$ cycloadditions have been found to date. However, it has been difficult to cyclize sterically hindered alkynes in a highly efficient and highly regioselective manner. For instance, the efficiency of the trimerization of internal alkynes bearing aryl and ester moieties, such as alkyl phenylpropiolate ( $\mathrm{PhC} \equiv \mathrm{CCO}_{2} \mathrm{R}$ ), is quite low. ${ }^{9}$ Therefore, a more general and efficient catalyst has been in great demand. In recent years, amine ligands have received considerable attention for their unique reactivity. ${ }^{11}$ For instance, Vicic and co-workers reported the $\mathrm{Ni}(\operatorname{cod})_{2} /$ tert-butylterpyridine-catalyzed cross-coupling reaction of alkyl zinc bromide and alkyl iodide. ${ }^{11 \mathrm{~d}}$ The ligand system could catalyze Negishi couplings at room temperature in an amide-free solvent. Okamoto and co-workers reported that the $\quad \mathrm{CoCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O} / 2$-iminomethylpyridine-catalyzed cycloaddition of diynes and alkynes proceeded efficiently. ${ }^{11 \mathrm{c}}$ The catalytic effect was specific to reactions with the 2 -aminomethylpyridine ligand and no effect was observed with phosphine ligands. The reactivities in these reactions are quite different from those in metal/phosphine ligand chemistry. These results led us to investigate the transition metal/amine ligand-catalyzed trimerization of internal alkynes. Recently, we performed the Corresponding authors. $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ /amine-catalyzed cyclization of alkynes, which can be widely used for internal alkynes. ${ }^{12}$ The cyclization of alkynes or diynes and alkynes proceeded smoothly to afford multi-substituted benzenes regioselectively in moderate to high yields.

## 2. Results and Discussions

The $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$-catalyzed cyclotrimerization of internal alkynes was performed successfully by the addition of a catalytic amount of an electron-rich and bulky alkylamine. First, using ethyl phenylpropiolate (1a) as a model substrate, the effect of the additives in the cyclotrimerization was investigated (Table 1). In the absence of amine, $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ catalyzed the cyclotrimerization of alkyne 1a to give cyclized product $\mathbf{2 a}$ in only $20 \%$ yield (entry 1 ). On the other hand, the trimerization of alkyne 1a was efficiently promoted by the addition of tert-amines. In the presence of $\mathrm{Et}_{3} \mathrm{~N}$, which is a frequently used base, the yield of the products increased to $67 \%$ (entry 2). To compare the effect of $\mathrm{Et}_{3} \mathrm{~N}$ with that of other amines, we examined the cyclotrimerization of alkyne 1a using various electron-rich amines (entries 3-6). The trimerization of alkyne 1a using $i-\mathrm{Pr}_{2} \mathrm{NEt}, \mathrm{Me}_{3} \mathrm{SiNEt}_{2}$, and dicyclohexylmethylamine ( $\mathrm{Cy}_{2} \mathrm{NMe}$ ), gave cycloadducts $\mathbf{2 a}$ and $3 \mathbf{a}$ in respective yields of 91,80 , and $75 \%$ (entries 3-5). Only in the case of $\mathrm{N}^{\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)_{3} \mathrm{~N} \text { was the yield of products } 2 \mathrm{a}}$ and 3a significantly reduced ( $24 \%$, entry 6 ). These facts indicate that the reactivity would be influenced by the bulkiness of the tert-amines. Indeed, the yields of cyclized products $2 a$ and $3 a$ increased with an increase in the
bulkiness of the amines: $i-\mathrm{Pr}_{2} \mathrm{NEt}(91 \%)>\mathrm{Et}_{3} \mathrm{~N}(67 \%)>$ $\mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)_{3} \mathrm{~N}(24 \%)$. Next, the cyclotrimerization of 1 a using $\mathrm{PhNMe}_{2}$ and $\mathrm{Ph}_{3} \mathrm{~N}$, the yields of cycloadducts 2a and 3a dramatically decreased (entries 7 and 8). These results suggest that such electron-deficient amines are not effective in cyclotrimerization. Pyridine was not effective, and starting material 1a was recovered quantitatively, probably due to the generation of $\mathrm{RhCl}_{3}(\mathrm{py})_{3}$, which might not be an active catalyst for the reaction (entry 9). ${ }^{13}$ In a similar manner, the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$-catalyzed cyclotrimerization was performed with sec- and prim-amines, affording cycloadducts 2 a and 3 a in yields of 17-69\% (entries $10-$ 12). Among the examined sec- and prim-amines, electronrich and bulky amines, e.g., $i-\mathrm{Pr}_{2} \mathrm{NH}$, were the most effective (entry 10). Bidentate amines such as TMEDA ( $N, N, N^{\prime}, N^{\prime}$-tetramethylethylenediamine) and 2,2'-bipyridyl were not effective at all (entries 13 and 14). Interestingly, commonly used phosphine ligands were not effective for the cyclotrimerization (entries 15-20). With alkyl phosphines, the yields of cyclized products $2 \mathbf{a}$ and $3 \mathbf{a}$ were lower than $6 \%$ (entries 15-17). $\mathrm{PPh}_{3}$ and bidentate phosphines were not effective at all (entries 18-20). Above all, it has been found that the presence of an electron-rich and bulky amine is essential for the cyclotrimerization reaction. In particular, $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ is the best combination for promoting the cyclotrimerization of alkyne 1a, probably due to the generation of an "active catalyst" in situ.

[^1]To evaluate the catalytic activity of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$, several transition metal catalysts were used for the cyclotrimerization of ethyl phenylpropiolate (1a) (Table 2). First, other $\mathrm{Rh}(\mathrm{III})$ catalysts were employed for the reaction (entries 1 and 2). $\mathrm{RhCl}_{3}$ (anhydrous) exhibited an activity similar to that of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$, affording cyclized products 2a and 3a in yields of $89 \%$ and resulting in high product selectivity (2a:3a = 99:1) (entry 1). This fact suggested that the presence of a small amount of water might not affect the reaction. On the other hand, $\mathrm{Rh}(\mathrm{acac})_{3}(\mathrm{acac}=$ acetylacetonate) was not effective (entry 2), resulting in the formation of only $6 \%$ yields of cyclized products 2a and 3a. $\left[\mathrm{Rh}(\mathrm{OAc})_{2}\right]_{2}$, a $\mathrm{Rh}(\mathrm{II})$ catalyst, also showed poor catalytic activity to afford $11 \%$ yields of cyclized products 2a and 3a (entry 3). Next, $\mathrm{Rh}(\mathrm{I})$ catalysts were utilized for the trimerization of 1a (entries 4-7). Among the Rh(I) catalysts examined thus far, no catalyst showed higher activity and higher regioselectivity than $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$. Cationic $\mathrm{Rh}(\mathrm{I})$ complexes have received great attention as useful catalysts for cycloadditions. The reaction of alkyne 1a with $\left[\mathrm{Rh}(\operatorname{cod})_{2}\right]\left[\mathrm{BF}_{4}\right]$ (cod $=1,5$-cyclooctadiene) gave moderate yields of cyclized products $2 \mathbf{2}$ and $3 \mathbf{3}$, but exhibited poor regioselectivity less than that with $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(2 \mathbf{a}: 3 \mathbf{a}=$ 69:31) (entry 4). Using neutral $\mathrm{Rh}(\mathrm{I})$ catalysts such as $[\mathrm{RhCl}(\text { cod })]_{2}, \mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}$, and $\mathrm{Rh}(\mathrm{acac})$ (cod), the yields and the regioselectivities of the cyclized products decreased significantly (entries 5-7). Notably, the reaction catalyzed by $\mathrm{RhCl}\left(\mathrm{PPh}_{3}\right)_{3}$, which is one of the typical catalysts for the trimerization reaction, gave the cyclized products in a yield of $60 \%$ and in the ratio of $62: 38(2 a: 3 a=37 \%: 23 \%)$ (entry 6). Several other metal catalysts were also employed in the reaction. The trimerization of alkyne 1a using $\mathrm{PdCl}_{2}, \mathrm{PtCl}_{2}$, and $\mathrm{IrCl}_{3}$ gave cycloadducts 2a and 3a in respective yields of a trace, $10 \%$, and $3 \%$ (entries $8-10$ ). With other metal halides, such as $\mathrm{CoCl}_{2}, \mathrm{CoCl}_{2} \bullet 3 \mathrm{H}_{2} \mathrm{O}, \mathrm{NiCl}_{2}, \mathrm{RuCl}_{3} \cdot \mathrm{nH}_{2} \mathrm{O}$, $\mathrm{CrCl}_{2}, \mathrm{CrCl}_{3}, \mathrm{FeCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}, \mathrm{CuCl}, \mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \mathrm{SmCl}_{3}$, $\mathrm{TiCl}_{4}, \mathrm{ZnCl}_{2}, \mathrm{PbCl}_{2}$, and $\mathrm{BiCl}_{3}$, cyclized products 2a and $\mathbf{3 a}$ were not obtained at all. Above all, among thus far examined catalysts, the most effective catalyst is $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ which can promote the cyclotrimerization efficiently in a virtually complete regioselective manner.

The reaction efficiency of the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}-$ catalyzed cyclization of $\mathbf{1 a}$ was highly influenced by the amounts and the ratio of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ and $i-\mathrm{Pr}_{2} \mathrm{NEt}$ (Table 3). In the presence of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(8 \mathrm{~mol} \%)$ and $i-\mathrm{Pr}_{2} \mathrm{NEt}$ ( $30 \mathrm{~mol} \%$ ), the cyclotrimerization of alkyne 1a occurred smoothly to give products $\mathbf{2 a}$ and $3 \mathbf{3}$ in $91 \%$ yield (entry 1 ). The ratio of the amount of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ to that of $i-\mathrm{Pr}_{2} \mathrm{NEt}$ significantly affected the product yield (entries $2-5$ ), and the best yields of cycloadducts $\mathbf{2 a}$ and $\mathbf{3 a}$ were obtained with a $1: 3$ mixture of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ and $i-\mathrm{Pr}_{2} \mathrm{NEt}$ (entry 3 ). When the amount of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ was decreased to 2 $\mathrm{mol} \%$ and $1 \mathrm{~mol} \%$, the yields of products $2 \mathbf{a}$ and $3 \mathbf{a}$ decreased to $71 \%$ and $57 \%$ yield, respectively (entries 6 and 7). From these results, it was found that the cyclotrimerization of $\mathbf{1 a}$ required approximately 3 equivalents of $i$ - $\mathrm{Pr}_{2} \mathrm{NEt}$ in comparison to $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$, and the yields of products $\mathbf{2 a}$ and $\mathbf{3 a}$ decreased with an increase or decrease in the amount of $i-\mathrm{Pr}_{2} \mathrm{NE}$. With $3 \mathrm{~mol} \%$ $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ and $9 \mathrm{~mol} \%$ of the $i-\mathrm{Pr}_{2} \mathrm{NEt}$ catalyst, cycloadducts 2a and 3a were obtained in the highest yield (93\%).

The effect of the solvent on the cyclotrimerization was investigated. In several solvents, the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}-$ catalyzed cyclotrimerization of $\mathbf{1 a}$ was performed at reflux (Table 4). In toluene, the cyclotrimerization of alkyne 1a afforded cycloadducts $\mathbf{2 a}$ and $\mathbf{3 a}$ in $91 \%$ yields in the ratio of 96:4 (entry 1). Other aromatic hydrocarbon such as oxylene and benzene were used for the reaction, resulting in a decrease in the yields of adducts 2a and 3a ( $87 \%$ and $67 \%$ ) (entries 2 and 3). Ethers could also be used for the reaction. When the reaction was carried out in DME (1,2-
dimethoxyethane) or 1,4-dioxane, cycloadducts 2a and 3a were obtained in yields of 87 and $83 \%$, respectively (entries 4 and 5). In THF, the yields of products 2a and 3a dramatically decreased to $47 \%$ (entry 6). $\mathrm{Et}_{2} \mathrm{O}$ was not of any use, and most of starting material 1a was recovered (entry 7). These facts indicated that the yields of cyclotrimerization products $2 \mathbf{2 a}$ and 3 a could be affected by the reaction temperature (refluxing temperature of the solvents). Indeed, the yields of the cyclized products increased with an increase in the reaction temperature: oxylene ( $144{ }^{\circ} \mathrm{C}$ ), toluene ( $111^{\circ} \mathrm{C}$ ), 1,4-dioxane ( $101^{\circ} \mathrm{C}$ ), or DME $\left(83{ }^{\circ} \mathrm{C}\right)>$ benzene $\left(80{ }^{\circ} \mathrm{C}\right)>$ THF $\left(66^{\circ} \mathrm{C}\right)>\mathrm{Et}_{2} \mathrm{O}$ $\left(35^{\circ} \mathrm{C}\right)$. Alcohols could be also utilized in the trimerization of alkyne $\mathbf{1 a}$ (entries 8 and 9). The cyclotrimerization of 1a in $i-\mathrm{PrOH}$ afforded products 2 a and 3 a in $86 \%$ yield, while the regioselectivity was lower than that in toluene (2a:3a = 85:15) (entry 8). In other solvents, such as $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{H}_{2} \mathrm{O}$, 1,2-dichloroethane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, similar cyclotrimerization occurred to afford $18-59 \%$ yields of adducts $2 \mathbf{a}$ and $\mathbf{3 a}$ in the ratio of 72:28-89:11 (entries 10-13). Alkanes, e.g., hexane and heptane, were not of any use; thus, most of starting material 1a was recovered (entries 14 and 15). Above all, it was found that several kinds of solvents could be used and the best choice of the solvent is toluene, in which, the best yields and highest regioselectivity could be attained (91\%, 2a:3a $=96: 4$ ). Thus, $\mathrm{RhCl}_{3} \bullet 3 \mathrm{H}_{2} \mathrm{O} / \mathrm{i}-$ $\mathrm{Pr}_{2} \mathrm{NEt} /$ toluene is the best combination for promoting the cyclotrimerization of alkyne 1a.

Table 4
Cyclotrimerization of alkyne 1a in several solvents

Next, the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ catalyst was applied to the cyclotrimerization of various alkynes (Table 5). In the
presence of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ ( $8 \mathrm{~mol} \%$ ) and $i-\mathrm{Pr}_{2} \mathrm{NEt}$ (30 $\mathrm{mol} \%$ ), several internal alkynes could successfully undergo the cyclotrimerization to give the corresponding cyclized products (entries 1-11). The cyclotrimerization of alkynes 1a-c bearing phenyl group smoothly proceeded in highly regioselective manner to predominantly afford cycloadducts $2 \mathbf{a}-\mathbf{c}$; indeed, the total yields of cycloadducts 2 and 3 were $85-91 \%$ and the ratio of 2:3 was more than 96:4 (entries $1-3$ ). On the other hand, alkyne 1d bearing no phenyl group underwent the cyclotrimerization to afford the corresponding adducts, but a slight decline in the regioselectivity was observed (2d:3d $=76: 24$ ) (entry 4). This fact suggested that the regioselectivity of the cyclotrimerization of alkyne was affected by the phenyl group. Notably, in the cyclotrimerization of alkynes 1a, 1c and 1d, the amount of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ could be reduced to $3 / 9 \mathrm{~mol} \%$ without an apparent change in the products yields. The cyclotrimerization of symmetrical internal alkynes 1e and 1f, gave cycloadducts 2 e and $\mathbf{2 f}$ in respective yields of 96 and $73 \%$ (entries 5 and 6). Dimethyl acetylenedicarboxylate (DMAD, 1g), an active well-used alkyne in cycloaddition, was unsuitable for the reaction (2g: 46\% yield, entry 7).. As we recently reported, dithienylacetylenes could be utilized in the reaction. ${ }^{12 a}$ The cyclotrimerization of di(2-thienyl)acetylene and its derivatives $(\mathbf{1} \mathbf{h}-\mathbf{j})$ afforded corresponding hexakis(2thienyl)benzenes ( $\mathbf{2 h} \mathbf{-} \mathbf{j}$ ) in respective yields of 49,63 , and $50 \%$ (entries 8-10). Using di(3-thienyl)acetlylene (1k), trimerized product $\mathbf{2 k}$ was obtained in 23\% yield (entry 11). In a similar manner, terminal alkynes 11-o were subjected to the $\mathrm{Rh} /$ amine-catalyzed trimerization (entries 12-15). The trimerization of phenylacetylene (11) gave cycloadducts $\mathbf{2 l}$ and $3 \mathbf{1}$ in 98\% in the ratio of 94:6 (entry 12). The reaction of $p$-tolylacetylene (1m) proceeded in a highly selective manner to predominantly afford cyclized products $\mathbf{2 m}$ (total yield $97 \%$ ) ( $2 \mathrm{~m}: 3 \mathrm{~m}=>99:<1$ ) (entry 13). The trimerization of 1-octyne (1n) afforded cycloadducts $2 n$ and $3 \mathbf{n}$ in a total yield of $87 \%$, but the ratio of $\mathbf{2 n}: 3 \mathbf{n}$ dramatically decreased to $67: 33$ (entry 14). Upon the cyclotrimerization of ethyl propiolate (10), the yields of the corresponding adduct and the regioselectivity were reduced to $75 \%$ and $2 \mathbf{o}: 3 \mathrm{o}=74: 26$ (entry 15). Above all, unsymmetrically substituted acetylene afforded asymmetric adducts $2 \mathbf{2 a - d}$ and $2 \mathbf{l}-\mathbf{o}$ as the major products in good to excellent yields. The regioselectivity in the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / \mathrm{i}-$ $\mathrm{Pr}_{2} \mathrm{NEt}$-catalyzed cyclotrimerization was highly influenced by the aryl substituents of the alkynes; indeed, the cyclotrimerization of alkynes bearing phenyl or tolyl groups proceeded with virtually complete regioselectivities (entries $1-3,12$, and 13).

The regioselectivity in the $\mathrm{RhCl}_{3} /$ amine-catalyzed cyclotrimerization was highly influenced by the substituents of alkynes. In particular, the reaction of alkynes bearing aryl groups proceeded with virtually complete regioselectivities. A plausible mechanism of the reaction is illustrated in Scheme 1. First, $\mathrm{RhCl}_{3}$ would be reduced by $i-\mathrm{Pr}_{2} \mathrm{NEt}$ to afford a $\mathrm{Rh}(\mathrm{I})$ complex. Thus generated electron-rich $\mathrm{Rh}(\mathrm{I})$ species might interact with two alkynes by strong $\pi$-back donation to form a rhodacyclopentadienyl complex. The insertion of another alkyne to the complex and the subsequent reductive elimination afford the corresponding cyclized product. When alkynes bearing an aryl group were employed, $\operatorname{di}(\alpha-$ aryl)rhodacyclopentadienes would be favorable than $\operatorname{di}(\beta$ aryl) ones. It might be the reason for the regioselective formation of the triarylbenzenes (Table 5, entries $1-3,12$, and 13).

Scheme 1. A plausible mechanism

To obtain further insight into the mechanism, we attempted to capture the in situ generated $\mathrm{Rh}(\mathrm{I})$ catalyst. To a solution of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ in $i-\mathrm{PrOH}, i-\mathrm{Pr}_{2} \mathrm{NEt}$ was added and the mixture was stirred at room temperature for 0.5 h . After the solution was concentrated, the residual black solids were purified by GPC (gel permeation chromatography) to afford the colorless crystals, which were easily deliquescent in air. In the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of the complex, the peaks of $i-\mathrm{Pr}_{2} \mathrm{NEt}$ disappeared and new ethyl and isopropyl peaks were observed, suggesting the coordination of $i-\mathrm{Pr}_{2} \mathrm{NEt}$ to the Rh center (Figures 1 and 2). Though the specific structure of the rhodium complex is not clear at present, the existence of a rhodium complex bearing $i-\mathrm{Pr}_{2} \mathrm{NEt}$ is strongly indicated.

Figure 1. ${ }^{1} \mathrm{H}$ NMR analysis of $i-\mathrm{Pr}_{2} \mathrm{NEt}$ and $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ complex.

Figure 2. ${ }^{13} \mathrm{C}$ NMR analysis of $i-\mathrm{Pr}_{2} \mathrm{NEt}$ and $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ complex.

The combination of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ and $i-\mathrm{Pr}_{2} \mathrm{NEt}$ was successfully used in the $[2+2+2]$ cycloaddition of diyne and various alkynes (Table 6). In the presence of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$, a mixture of diyne $4 \mathbf{a}$ and phenylacetylene (11, 4 equiv) in $i-\mathrm{PrOH}$ was stirred at $50{ }^{\circ} \mathrm{C}$ for 5 h to afford cycloadduct 5al in $81 \%$ yield and $16 \%$ of $\mathbf{6 a}$ (entry 1 ). When the reaction was carried out at reflux, the yields of $5 \mathbf{5 l}$ and $\mathbf{6 a}$ were almost the same as those in the reaction at $50{ }^{\circ} \mathrm{C}$ (entry 2). Next, the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$-catalyzed cyclization of diyne 4a and 1-octyne (1n) was performed at $50^{\circ} \mathrm{C}$ for 5 h to afford cycloadduct 5 an in $60 \%$ yield (entry 3 ). When the reaction was carried out at reflux, the yield of 5an increased to $82 \%$ (entry 4). In this case, the reaction proceeded much efficiently at a higher temperature. Internal alkynes could also be utilized in the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$-catalyzed cycloaddition (entries 5-9). Using ethyl phenylpropiolate (1a), cyclized product 5 aa was obtained in $39 \%$ yield together with $60 \%$ of $\mathbf{6 a}$ (entry 5). When the reaction was carried out at reflux, the yield of 5aa was almost the same as that in the reaction performed at $50^{\circ} \mathrm{C}$, but the yield of 6a decreased, resulting in the generation of by-products such as polymer (entry 6). The cycloaddition of diyne 4a and alkyne 1c at $50{ }^{\circ} \mathrm{C}$ or reflux gave the cycloadduct in respective yields of 43 and $48 \%$ (entries 7 and 8 ). When the reaction was carried out using alkyne $\mathbf{1 f}$, the yield of 5af was $45 \%$ (entry 9). Above all, the $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}-$ catalyzed cyclization of diyne $\mathbf{4 a}$ and terminal alkynes gave the corresponding products in high yields. In the reaction of 4a and internal alkynes, the yields of dimer 6a decreased under the refluxing condition, while no significant change was observed in the yields of $\mathbf{5 a}$, probably because generated $\mathbf{6 a}$ would react with $\mathbf{1}$ or $\mathbf{4 a}$ to give other products under the refluxing conditions.

Table 6
Cycloaddition of diyne and several alkynes

| Entry | $\mathrm{R}^{1}$ | $\mathrm{R}^{2}$ |  | Temp. | Time <br> (h) | Yield <br> $\mathbf{5 a} / \mathbf{6 a}(\%)^{\mathrm{a}}$ |  |

Next, the cycloaddition of diyne $\mathbf{4 b}$ and diphenylacetylene (1f) was performed. In the presence of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(8 \mathrm{~mol} \%)$ and $i-\mathrm{Pr}_{2} \mathrm{NEt}$ ( $30 \mathrm{~mol} \%$ ), to a solution of alkyne $\mathbf{1 f}$ in $i$ - PrOH was added dropwise diyne $\mathbf{4 b}$ at reflux, and the mixture was heated to reflux for an additional 24 h to afford $5 \mathbf{b f}$ in $46 \%$ yield and $45 \%$ of $\mathbf{4 b}$ was recovered (Scheme 2). While the yield of $\mathbf{5 b f}$ was still moderate, the generation of $\mathbf{6 b}$, the dimer of $\mathbf{4 b}$, was not observed, and hexa-substituted benzene derivative 5bf was obtained chemoselectively.

Scheme 2. Cycloaddition of diyne $\mathbf{4 b}$ and diphenylacetylene (1f).

## 3. Conclusion

The $[2+2+2]$ cyclotrimerization of alkynes proceeds with high reactivity when the combination of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt} /$ toluene is used. The reaction can be widely used for various mono- and di-substituted acetylenes and provides tri- or hexa-substituited benzenes
regioselectively in high yields. The [2+2+2] cycloaddition of diynes and alkynes has also been developed by using a $\mathrm{Rh} /$ amine complex, and it providies benzene derivatives in moderate to high yields.

## 4. Experimental

### 4.1. General remarks

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Varian INOVA UNITY $600\left({ }^{1} \mathrm{H} \quad 600 \mathrm{MHz},{ }^{13} \mathrm{C} \quad 150 \mathrm{MHz}\right)$ spectrometers in $\mathrm{CDCl}_{3}$ using TMS or residual chloroform as internal standard. Splitting patterns are designated as s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; dd, double doublet; and tt , triple triplet. Coupling constants are reported in hertz (Hz). IR spectra were recorded on a JASCO FT/IR-4100 spectrophotometer in wave number $\left(\mathrm{cm}^{-1}\right)$ and only major absorption bands are compiled. Analytic thin layer chromatography (TLC) was performed on Merck, pre-coated plate silica gel $60 \mathrm{~F}_{254}(0.25 \mathrm{~mm}$ thickness). Column chromatography was performed on KANTO CHEMICAL silica gel 60 N ( $40-50 \mu \mathrm{~m}$ ). Preparative recycling gel permeation chromatography (GPC) was performed with a JAI LC-9101 instrument equipped with JAIGEL-1H/JAIGEL-2H column using chloroform as an eluent. Elemental analysis was obtained with Perkin-Elmer PE 2400 Series II CHNS/O analyzer. Unless otherwise noted, all materials were obtained from commercial suppliers and used without further purification. Diynes $4 \mathbf{a}$ and $\mathbf{4 b}$ were prepared according to literature procedures. ${ }^{14}$ All reactions were performed in dry solvents under argon atmosphere. Toluene, benzene, xylene, 1,4dioxane, $i-\mathrm{PrOH}, \mathrm{CH}_{3} \mathrm{CN}$, dichloroethane, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, hexane and heptane were distilled from $\mathrm{CaH}_{2}$. DME, THF, $\mathrm{Et}_{2} \mathrm{O}$ and EtOH were distilled from sodium benzophenone ketyl under argon.

### 4.2. General procedure for Rh/amine-catalyzed cyclotrimerization of internal alkyne

To a suspension of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(10 \mathrm{mg}, 0.04 \mathrm{mmol})$ in toluene ( 3.0 mL ) were added $i-\operatorname{Pr}_{2} \mathrm{NEt}(26 \mu \mathrm{~L}, 0.15 \mathrm{mmol})$ and ethyl phenylpropiolate 1a ( $87 \mathrm{mg}, 0.50 \mathrm{mmol}$ ). The mixture was stirred at reflux for 24 h . After being cooled to room temperature, the reaction mixture was concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (hexane/EtOAc 5:1) to afford 1,2,4-triethoxycarbonyl-3,5,6-triphenylbenzene 2a ( $79 \mathrm{mg}, 91 \%$ ) as colorless solids.

### 4.2.1. 1,2,4-Triethoxycarbonyl-3,5,6-triphenylbenzene $(2 a)^{9 d}$

Colorless solids; $R_{f}=0.20$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.68(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 0.87(\mathrm{t}, J=$ $7.2 \mathrm{~Hz}, 3 \mathrm{H}), 0.90(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 3.65(\mathrm{q}, J=7.2 \mathrm{~Hz}$, $2 \mathrm{H}), 3.94(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.98(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H})$, 7.00-7.04 (m, 4H), 7.11-7.14 (m, 6H), $7.35(\mathrm{~s}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 13.3,13.41,13.43,60.9$, $61.50,61.51,127.1,127.3,127.4,127.5,127.9,128.0$, $128.9,129.8,129.9,132.0,134.1,137.2,137.3,137.4$,

4.3. General procedure for $R h / a m i n e-c a t a l y z e d ~$ cyclotrimerization of di(thienyl)acetylene

To a solution of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(11 \mathrm{mg}, 0.04 \mathrm{mmol})$ in $i$ $\operatorname{PrOH}(3.0 \mathrm{~mL})$ were added $i-\mathrm{Pr}_{2} \mathrm{NEt}(26 \mu \mathrm{~L}, 0.15 \mathrm{mmol})$ and di(2-thienyl)acetylene $\mathbf{1 h}(96 \mathrm{mg}, 0.50 \mathrm{mmol})$. The mixture was stirred at reflux for 24 h . After being cooled to room temperature, the reaction mixture was filtered and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (hexane/toluene 5:1) to afford hexa(2-thienyl)benzene $\mathbf{2 h}$ ( $47 \mathrm{mg}, 49 \%$ ) as yellow solids.

### 4.3.1. Hexa(2-thienyl)benzene (2h)

Yellow solids; $R_{f}=0.27$ (hexane/toluene 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.59(\mathrm{dd}, J=3.6,1.2 \mathrm{~Hz}, 6 \mathrm{H}), 6.68$ (dd, $J=5.4,3.6 \mathrm{~Hz}, 6 \mathrm{H}$ ), $7.08(\mathrm{dd}, J=5.4,1.2 \mathrm{~Hz}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 125.8,126.2,129.1,137.0$, 140.7; IR (KBr) 3068, 2923, 2360, 1647, 1381, $694 \mathrm{~cm}^{-1}$; Anal. Calcd for $\mathrm{C}_{30} \mathrm{H}_{18} \mathrm{~S}_{6}$ : C, 63.12; H, 3.18. Found: C, 63.08; H, 3.36.

In a similar manner, the $\mathrm{Rh} /$ amine-catalyzed cyclotrimerization of di(thienyl)acetylene derivatives $\mathbf{1 i}-\mathbf{1 k}$ was carried out. The reaction conditions and the results are illustrated in Table 5.

### 4.3.2. Hexakis(5-methyl-2-thienyl)benzene (2i)

Yellow solids; $R_{f}=0.23$ (hexane/toluene 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 6.33(\mathrm{~s}, 12 \mathrm{H}), 2.30(\mathrm{~s}, 18 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 15.2,123.9,128.7,137.0,138.8$, 140.2; IR (KBr) 3068, 2912, 2855, 2357, 1747, 1442, 1219, $800 \mathrm{~cm}^{-1}$; Anal. Calcd for $\mathrm{C}_{36} \mathrm{H}_{30} \mathrm{~S}_{6}: \mathrm{C}, 66.01 ; \mathrm{H}, 4.62$. Found: C, 66.09; H, 4.53.

### 4.3.3. Hexakis(5-acetyl-2-thienyl)benzene (2j)

Colorless solids; $R_{f}=0.07$ (hexane/EtOAc 3:1), ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.27(\mathrm{~d}, J=3.6 \mathrm{~Hz}, 6 \mathrm{H}), 6.67(\mathrm{~d}, J=$ $3.6 \mathrm{~Hz}, 6 \mathrm{H}), 2.43(\mathrm{~s}, 18 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$
26.7, 130.9, 131.8, 136.5, 145.8, 146.7, 190.7; IR (KBr) $3080,1658,1471,1381,1274 \mathrm{~cm}^{-1}$.

### 4.3.4. Hexa(3-thienyl)benzene (2k)

Brown solids; $R_{f}=0.27$ (hexane/EtOAc 3:1), ${ }^{1}$ H NMR ( 600 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.91(\mathrm{dd}, J=4.8,3.0 \mathrm{~Hz}, 6 \mathrm{H}), 6.58(\mathrm{dd}, J=$ $3.0,1.5 \mathrm{~Hz}, 6 \mathrm{H}$ ), 6.50 (dd, $J=4.8,3.6 \mathrm{~Hz}, 6 \mathrm{H}$ ) ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 123.3,124.1,129.7,136.5,140.3$; IR ( KBr ) 3068, 2923, 2360, 1647, 1381, 1223, $694 \mathrm{~cm}^{-1}$; Anal. Calcd for $\mathrm{C}_{30} \mathrm{H}_{18} \mathrm{~S}_{6}$ : C, 63.12; H, 3.18. Found: C, 63.08 ; H, 3.36.
4.4. General procedure for Rh/amine-catalyzed cyclotrimerization of terminal alkyne

To a suspension of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(11 \mathrm{mg}, 0.04 \mathrm{mmol})$ in toluene $(3.0 \mathrm{~mL})$ were added $i-\mathrm{Pr}_{2} \mathrm{NEt}(26 \mu \mathrm{~L}, 0.15 \mathrm{mmol})$ and phenylacetylene $\mathbf{1 l}(55 \mathrm{mg}, 0.50 \mathrm{mmol})$. The mixture was stirred at reflux for 12 h . After being cooled to room temperature, the reaction mixture was concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (hexane/EtOAc 5:1) to afford 1,2,4-triphenylbenzene $2 \mathbf{2 l}$ ( $54 \mathrm{mg}, 98 \%$ ) as colorless solids.

### 4.4.1. 1,2,4-Triphenylbenzene (2I) ${ }^{7 a, 15}$

Colorless solids; $R_{f}=0.57$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.17-7.24(\mathrm{~m}, 10 \mathrm{H}), 7.37(\mathrm{tt}, J=7.8$, $1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.45-7.48(\mathrm{~m}, 2 \mathrm{H}), 7.51(\mathrm{dd}, J=7.8,1.2 \mathrm{~Hz}$, 1H), 7.65-7.69 (m, 4H): ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ 126.1, 126.5, 126.6, 127.1, 127.4, 127.89, 127.92, 128.8, 129.4, 129.87, 129.90, 131.1, 139.5, 140.4, 140.6, 141.0, 141.1, 141.5; IR (KBr) 3075, 3056, $3027 \mathrm{~cm}^{-1}$.

In a similar manner, the $\mathrm{Rh} /$ amine-catalyzed cyclotrimerization of terminal alkynes $\mathbf{1 m}-\mathbf{1 o}$ was conducted. The reaction conditions and the results are illustrated in Table 5.

### 4.4.2. 1,2,4-Tris(4-methylphenyl)benzene (2m) ${ }^{3 g, 4 e}$

Colorless solids; $R_{f}=0.60$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 2.32(\mathrm{~s}, 3 \mathrm{H}), 2.33(\mathrm{~s}, 3 \mathrm{H}), 2.40(\mathrm{~s}$, $3 \mathrm{H}), 7.03-7.10(\mathrm{~m}, 8 \mathrm{H}), 7.26(\mathrm{dd}, J=7.8,0.6 \mathrm{~Hz}, 2 \mathrm{H})$, $7.46(\mathrm{dd}, J=7.8,0.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.56-7.62(\mathrm{~m}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.11,21.13,125.7,126.9$, 128.6, 128.7, 129.2, 129.5, 129.68, 129.71, 131.1, 136.0, 136.1, 137.1, 137.8, 138.3, 138.7, 139.1, 140.0, 140.8; IR ( KBr ) 3025, 2917, $2863 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{27} \mathrm{H}_{24}$ : C, 93.06; H, 6.94. Found: C, 92.67; H, 7.33.

### 4.4.3. 1,2,4-Trihexylbenzene (2n) ${ }^{4 e}$

Colorless liquid; $R_{f}=0.77$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.87-0.91(\mathrm{~m}, 9 \mathrm{H}), 1.28-1.39(\mathrm{~m}$, $18 \mathrm{H}), 1.54-1.59(\mathrm{~m}, 6 \mathrm{H}), 2.52-2.58(\mathrm{~m}, 6 \mathrm{H}), 6.92(\mathrm{dd}, J=$ $7.8,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.95(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.04(\mathrm{~d}, J=7.8$ $\mathrm{Hz}, 1 \mathrm{H})$.

[^2]Yellow liquid; $R_{f}=0.23$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.38(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.39(\mathrm{t}, J=$ $7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.41(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 4.39(\mathrm{q}, J=7.2 \mathrm{~Hz}$, $4 \mathrm{H}), 4.41(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.76(\mathrm{dd}, J=8.4,0.6 \mathrm{~Hz}, 1 \mathrm{H})$, $8.19(\mathrm{dd}, J=8.4,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.40(\mathrm{dd}, J=1.2,0.6 \mathrm{~Hz}$, 1H); ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 14.0,14.1,14.2,61.7$, $61.9,62.0,128.8,130.1,132.00,132.04,132.7,136.2$, $165.0,166.6,167.2$; IR (neat) 2983, 2938, 1727, $1244 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{O}_{6}$ : C, 61.22; H, 6.16. Found: C, 61.14; H, 6.60 .

### 4.4.5. 1,3,5-Triethoxycarbonylbenzene (3o) ${ }^{16}$

Colorless solids; $R_{f}=0.23$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.43(\mathrm{t}, J=7.2 \mathrm{~Hz}, 9 \mathrm{H}), 4.44(\mathrm{q}, J=$ $7.2 \mathrm{~Hz}, 6 \mathrm{H}), 8.85$ (s, 3H); ${ }^{13} \mathrm{C}$ NMR (150 MHz, $\mathrm{CDCl}_{3}$ ): $\delta$ 14.3, 61.7, 131.4, 134.4, 165.1; IR (KBr) 2943, 2907, 2877, 1724, $1240 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{O}_{6}: \mathrm{C}, 61.22 ; \mathrm{H}$, 6.16. Found: C, 61.46; H, 6.28 .

### 4.5. Synthesis of $\mathrm{RhCl}_{3} \bullet 3 \mathrm{H}_{2} \mathrm{O} / i-\mathrm{Pr}_{2} \mathrm{NEt}$ complex

To a solution of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(26 \mathrm{mg}, 0.1 \mathrm{mmol})$ in $i-\mathrm{PrOH}$ $(6 \mathrm{~mL})$ was added $i-\mathrm{Pr}_{2} \mathrm{NEt}(51 \mu \mathrm{~L}, 0.3 \mathrm{mmol})$. The mixture was stirred at room temperature (or reflux) for 0.5 h , and was concentrated under reduced pressure. The residue was purified by gel permeation chromatography. Then the solid was purified by recyclization, and colorless crystals were obtained.

### 4.6. General Procedure for Cyclization of Diyne 4a and Alkyne 1

To a solution of $\mathrm{RhCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}(11 \mathrm{mg}, 0.04 \mathrm{mmol})$ and $i$ $\mathrm{Pr}_{2} \mathrm{NEt}(26 \mu \mathrm{~L}, 0.15 \mathrm{mmol})$ in $i-\mathrm{PrOH}(2.0 \mathrm{~mL})$ were added phenylacetylene $\mathbf{1 1}(217 \mathrm{mg}, 2.0 \mathrm{mmol})$ and diyne $\mathbf{4 a}(116$ $\mathrm{mg}, 0.49 \mathrm{mmol}$ ) in $i-\mathrm{PrOH}(3.0 \mathrm{~mL})$. The mixture was stirred at reflux for 2 h . After being cooled to room temperature, the reaction mixture was concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (hexane/EtOAc 5:1) to afford diethyl 5-phenyl-1 H -indene-2,2(3H)-dicarboxylate 5al (138 $\mathrm{mg}, 81 \%$ ) as yellow liquid.

### 4.6.1. Diethyl 5-Phenyl-1H-indene-2,2(3H)-dicarboxylate $(5 a l)^{6 e}$

Yellow liquid; $R_{f}=0.37$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.25-1.28(\mathrm{~m}, 6 \mathrm{H}), 3.63(\mathrm{~s}, 2 \mathrm{H}), 3.66$ (s, 2H), $4.26(\mathrm{q}, J=7.2 \mathrm{~Hz}, 4 \mathrm{H}), 7.26-7.27(\mathrm{~m}, 1 \mathrm{H}), 7.32-$ $7.34(\mathrm{~m}, 1 \mathrm{H}), 7.39-7.43(\mathrm{~m}, 4 \mathrm{H}), 7.55-7.56(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 14.0,40.2,40.4,60.5,61.7$, $123.0,124.4,126.1,127.0,127.1,128.6,139.1,140.3$, 140.7, 141.3, 171.6; IR (neat) 3031, 2980, 2936, $1733 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{21} \mathrm{H}_{22} \mathrm{O}_{4}$ : C, 74.54; $\mathrm{H}, 6.56$. Found: C , 74.53; H, 6.74.

In a similar manner, the $\mathrm{Rh} /$ amine-catalyzed cyclotrimerization of diyne $\mathbf{4 a}$ and alkynes $\mathbf{1 a}, \mathbf{1 c}, \mathbf{1 f}$, and 1n was carried out. The reaction conditions and the results are illustrated in Table 6.
4.6.2. Diethyl 5-Hexyl-1H-indene-2,2(3H)-dicarboxylate $(5 a n)^{2 e}$

Orange liquid; $R_{f}=0.47$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.87-0.89(\mathrm{~m}, 3 \mathrm{H}), 1.24-1.33(\mathrm{~m}$, $12 \mathrm{H}), 1.54-1.60(\mathrm{~m}, 2 \mathrm{H}), 2.54(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.55(\mathrm{~s}$, $2 \mathrm{H}), 3.56(\mathrm{~s}, 2 \mathrm{H}), 4.20(\mathrm{q}, J=7.2 \mathrm{~Hz}, 4 \mathrm{H}), 6.97(\mathrm{~d}, J=7.2$ $\mathrm{Hz}, 1 \mathrm{H}), 7.01(\mathrm{~s}, 1 \mathrm{H}), 7.08(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 14.0,14.1,22.6,29.0,31.69,31.72$, 35.8, 40.1, 40.4, 60.5, 61.6, 123.8, 124.1, 127.1, 137.1, $140.0,141.8,171.8$; IR (neat) 2957, 2928, 2856, $1735 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{O}_{4}$ : C, 72.80; H, 8.73. Found: C, 72.79; H, 8.84.
4.6.3. Diethyl 5-Ethoxycarbonyl 6-Phenyl-1H-indene-2,2(3H)-dicarboxylate (5aa)

Colorless solids; $R_{f}=0.26$ (hexane/EtOAc 4:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.96(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=$ $7.2 \mathrm{~Hz}, 6 \mathrm{H}), 3.63(\mathrm{~s}, 2 \mathrm{H}), 3.65(\mathrm{~s}, 2 \mathrm{H}), 4.04(\mathrm{q}, J=7.2 \mathrm{~Hz}$, $2 \mathrm{H}), 4.22(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.19(\mathrm{~d}, J=0.6 \mathrm{~Hz}, 1 \mathrm{H})$, 7.26-7.28 (m, 2H), 7.30-7.37 (m, 2H), $7.66(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 13.6,14.0,40.0,40.4,60.4$, $60.8,61.8,125.5,126.4,126.9,127.9,128.3,130.2,139.2$, 141.66, 141.74, 143.7, 168.8, 171.3; IR (KBr) 3059, 3024, 2980, 2935, 2905, $1732 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{24} \mathrm{H}_{26} \mathrm{O}_{6}$ : C, 70.23; H, 6.38. Found: C, 70.15; H, 6.44.
4.6.4. Diethyl 5-Methyl 6-Phenyl-1H-indene-2,2(3H)dicarboxylate (5ac)

Yellow liquid; $R_{f}=0.40$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.27$ (t, $J=7.2 \mathrm{~Hz}, 6 \mathrm{H}$ ), 2.21 ( $\mathrm{s}, 3 \mathrm{H}$ ), $3.59(\mathrm{~s}, 2 \mathrm{H}), 3.60(\mathrm{~s}, 2 \mathrm{H}), 4.22(\mathrm{q}, J=7.2 \mathrm{~Hz}, 4 \mathrm{H}), 7.05(\mathrm{~s}$, $1 \mathrm{H}), 7.10(\mathrm{~s}, 1 \mathrm{H}), 7.28-7.33(\mathrm{~m}, 3 \mathrm{H}), 7.37-7.40(\mathrm{~m}, 2 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 14.0,20.4,40.2,40.3,60.5$, $61.7,125.5,126.6,128.0,129.2,134.1,137.5,139.1,140.8$, 142.1, 171.7; IR (neat) $3057,2980,2935,1733,1244 \mathrm{~cm}^{-1}$. Anal. Calcd for $\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{O}_{4}$ : C, 74.98; H, 6.86. Found: C, 74.93; H, 6.99.
4.6.5. Diethyl 5,6-Diphenyl-1H-indene-2,2(3H)dicarboxylate (5af)

Colorless solids; $R_{f}=0.39$ (hexane/EtOAc 4:1); ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.281(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.282(\mathrm{t}, J$ $=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 3.68(\mathrm{~s}, 4 \mathrm{H}), 4.240(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H})$, $4.241(\mathrm{q}, ~ J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.09-7.11(\mathrm{~m}, 4 \mathrm{H}), 7.15-7.20(\mathrm{~m}$, $6 \mathrm{H}), 7.25(\mathrm{~d}, J=0.6 \mathrm{~Hz}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 150 MHz , $\mathrm{CDCl}_{3}$ ): $\delta 14.0,40.3,60.5,61.8,126.3,127.8,129.9,139.4$, 139.6, 141.6, 171.7; IR (KBr) 3057, 2985, 2903, 1732, $1708 \mathrm{~cm}^{-1}$.

### 4.7. General Procedure for Cyclization of Diyne $\mathbf{4 b}$ and Alkyne 1f

To a solution of $\mathrm{RhCl}_{3} \bullet 3 \mathrm{H}_{2} \mathrm{O}(11 \mathrm{mg}, 0.04 \mathrm{mmol})$ and $i-$ $\operatorname{Pr}_{2} \operatorname{NEt}(26 \mu \mathrm{~L}, 0.15 \mathrm{mmol})$ in $i-\operatorname{PrOH}(2.0 \mathrm{~mL})$ were added diphenylacetylene 1f ( $900 \mathrm{mg}, 5.0 \mathrm{mmol}$ ) and diyne $\mathbf{4 b}$ ( $132 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) in $i-\mathrm{PrOH}(3.0 \mathrm{~mL})$. The mixture was stirred at reflux for 24 h . After being cooled to room
temperature, the reaction mixture was concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (hexane/EtOAc 5:1) to afford diethyl 4,7-dimethyl-5,6-diphenyl-1 H -indene-2,2(3H)dicarboxylate $5 \mathbf{b f}$ ( $102 \mathrm{mg}, 46 \%$ ) and $45 \%$ of $\mathbf{4 b}$ was recovered.

Diethyl 4,7-Dimethyl-5,6-diphenyl-1H-indene-2,2(3H)dicarboxylate (5bf)

Red liquid; $R_{f}=0.50$ (hexane/EtOAc 5:1); ${ }^{1} \mathrm{H}$ NMR ( 600 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.32(\mathrm{t}, J=7.2 \mathrm{~Hz}, 6 \mathrm{H}$ ), $2.00(\mathrm{~s}, 6 \mathrm{H}), 3.69$ (s, 4H), $4.28(\mathrm{q}, J=7.2 \mathrm{~Hz}, 4 \mathrm{H}), 6.92(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 4 \mathrm{H})$, 7.04-7.06 (m, 2H), 7.10-7.12 (m, 4H); ${ }^{13} \mathrm{C}$ NMR ( 150 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 13.7,19.2,30.7,64.4,118.2,128.0,128.8$, 130.2, 134.4, 144.5, 167.1; IR (neat) 3056, 3021, 2981, $2935,1733,1242 \mathrm{~cm}^{-1}$.
