# Background

- Current anti-TB administration strategies are based on long-term oral dosing
- Oral administration is characterised by suboptimal adherence which represents a leading cause of treatment failure
- 20 to 50% of patients fail to complete existing tuberculosis treatment
- Injectable long-acting nano-formulations have been applied in numerous disease areas to simplify drug administration
- Long-acting administration of anti-TB agents could represent a valuable pharmacological strategy

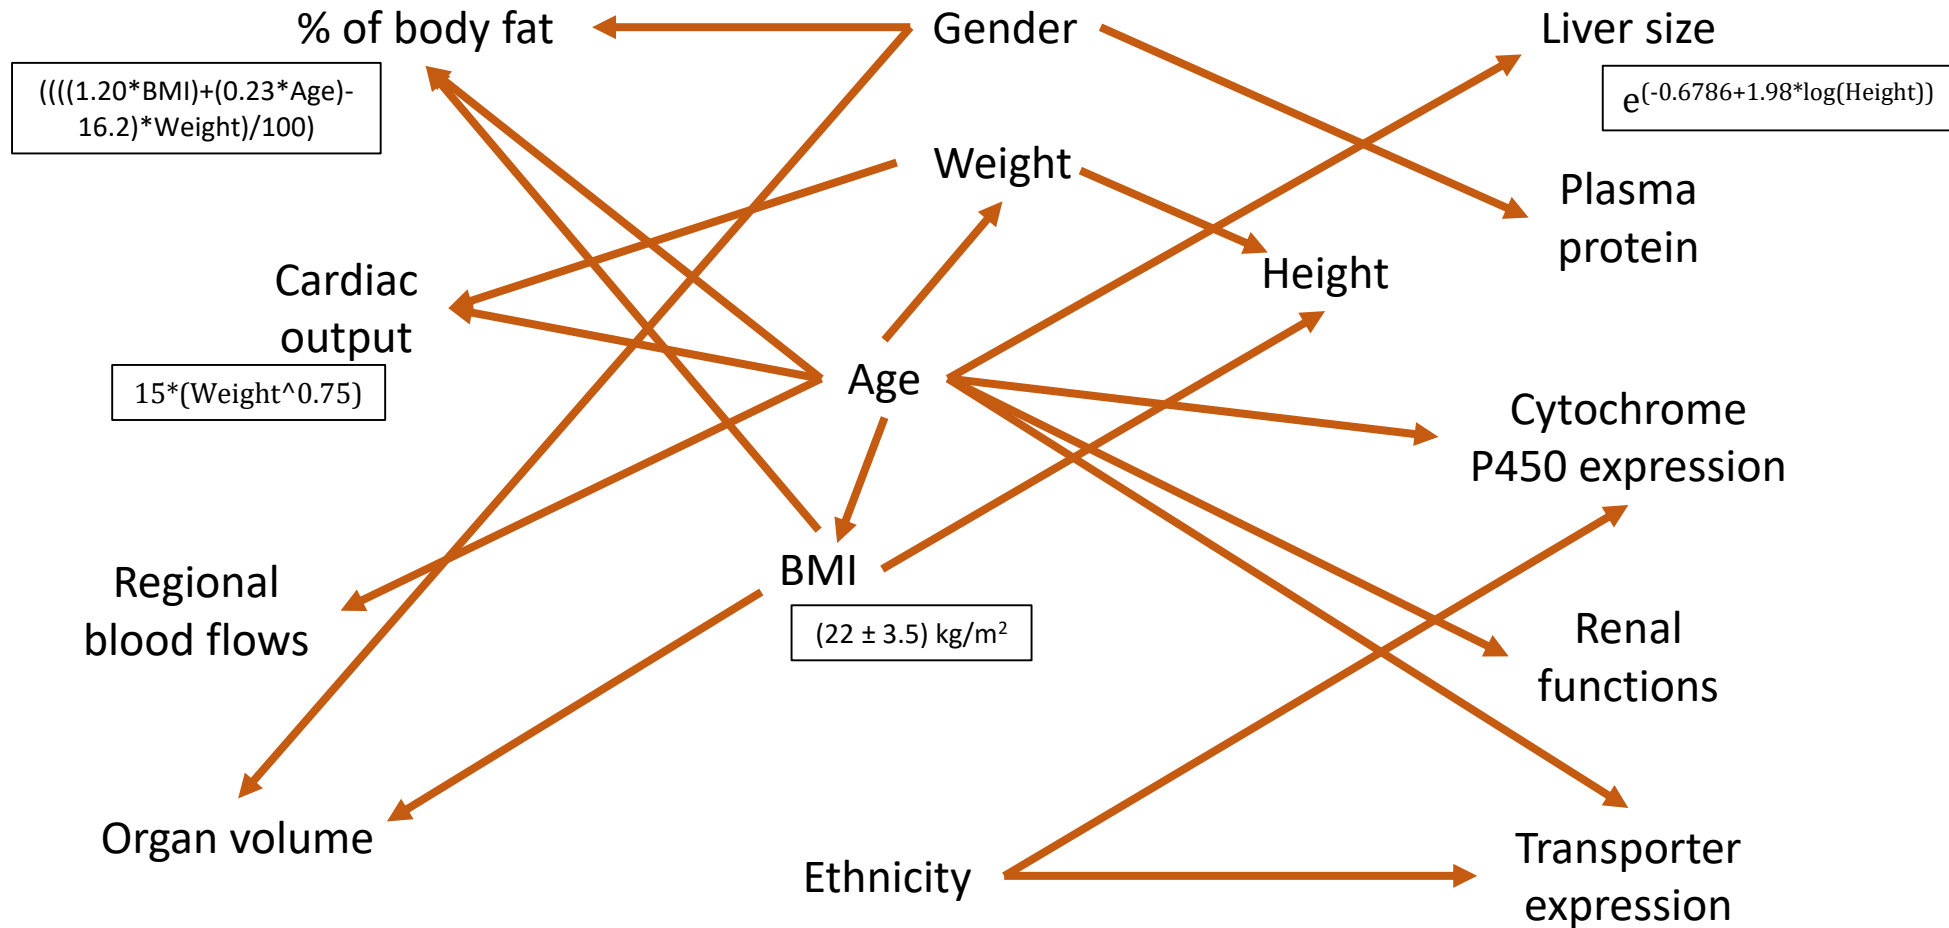

# Aims

- Design and validate a physiologically based pharmacokinetic (PBPK) model for existing oral anti-TB agents
- Simulate the pharmacokinetics of long-acting formulations of anti-TB agents in adult individuals

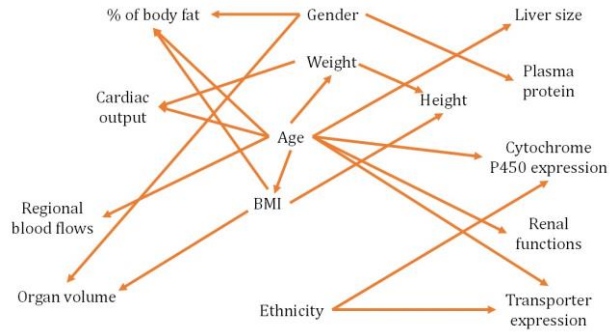

# PBPK model

- Physiologically based pharmacokinetic (PBPK) modelling was used to inform the pharmacokinetics of anti-TB agents in adults
  - Mathematical description of absorption, distribution, metabolism and elimination processes defining pharmacokinetics
  - PBPK modelling integrates *in vitro* and clinical data to simulate drug distribution in virtual population

# Parameter correlation

# Population variability

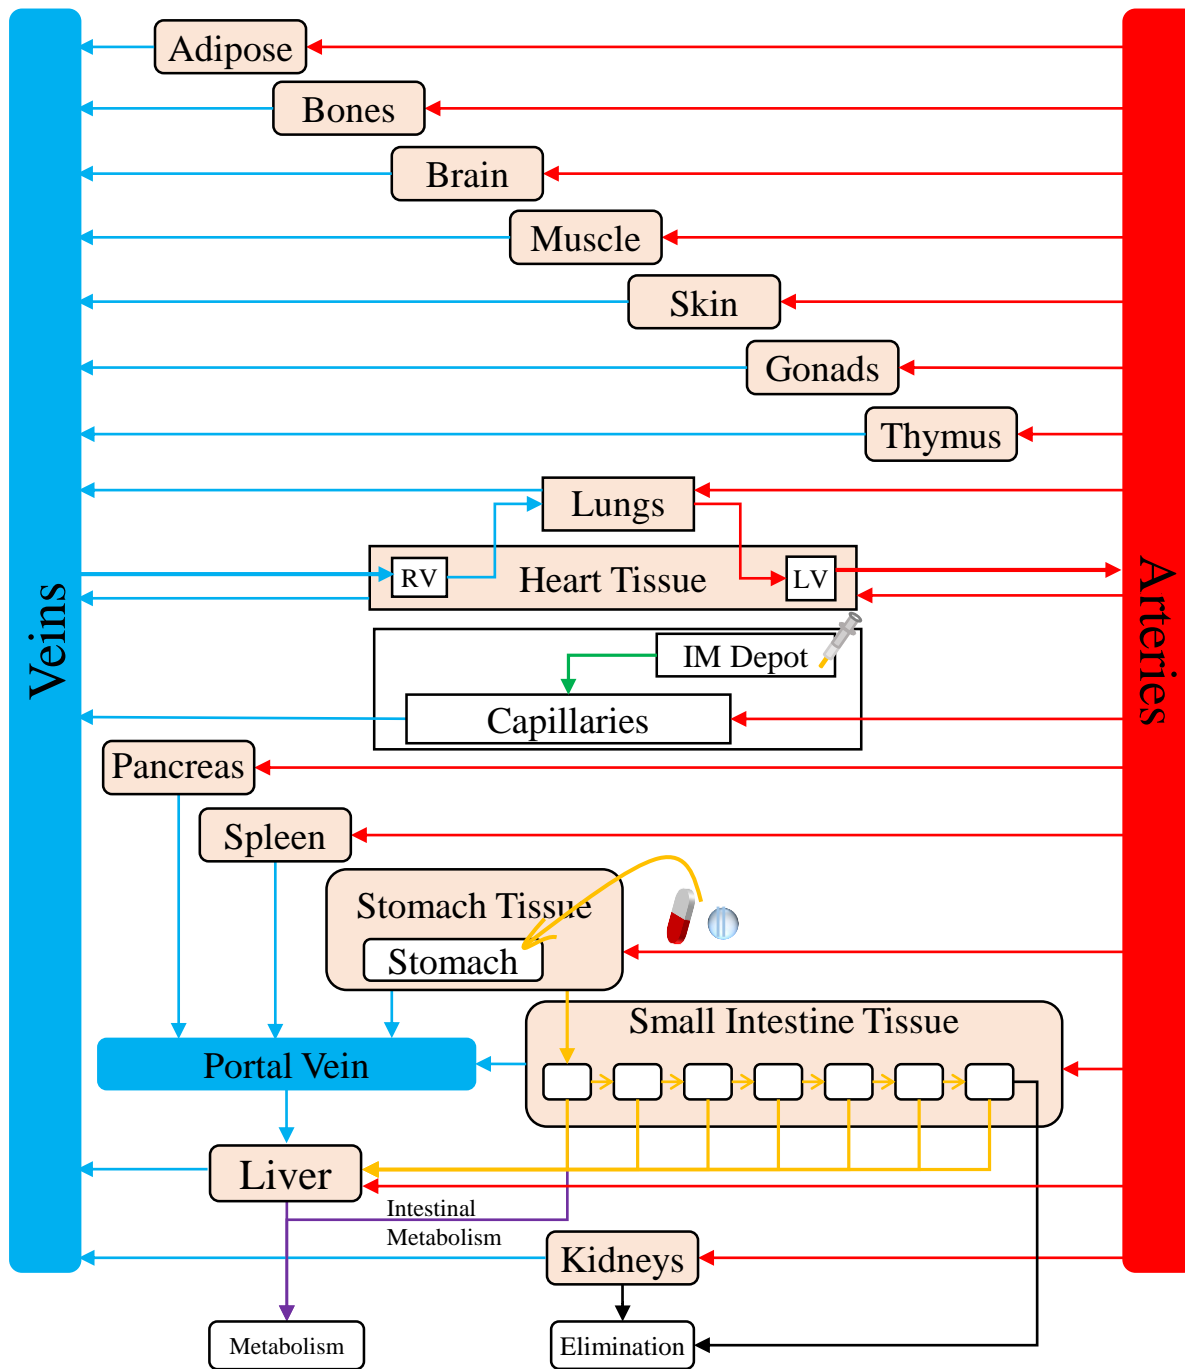

Essential PBPK Parameters

Variability

Virtual population

# Intramuscular release rate

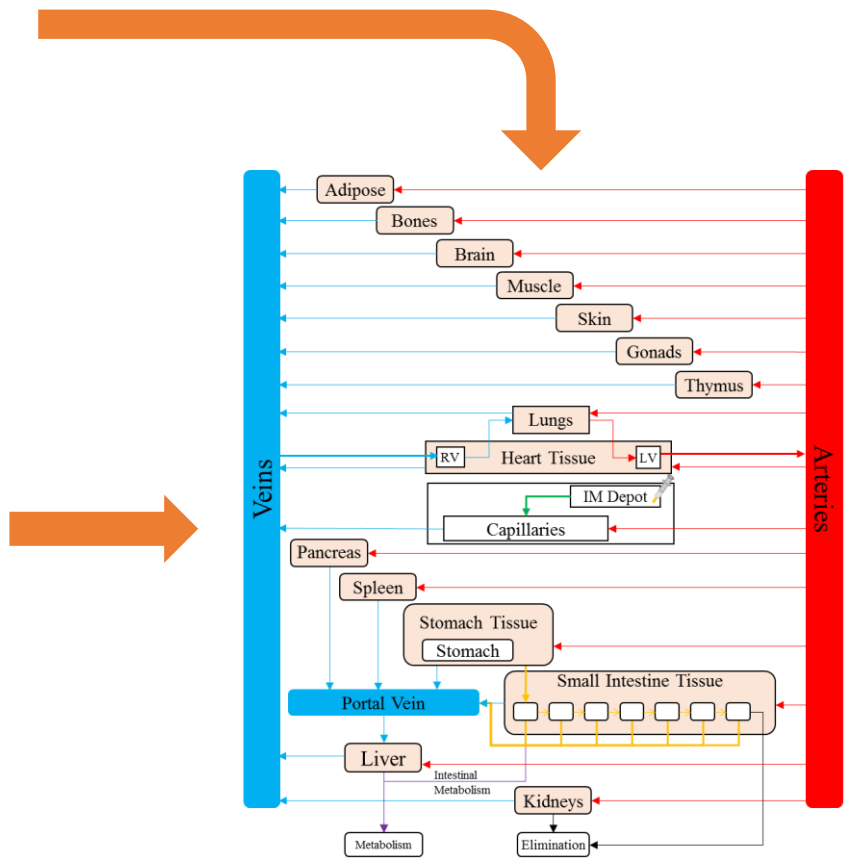

# Metabolic clearance

# Volume of distribution

$$V_{ss} = (\sum V_t^* P_{t:p}) + (V_e^* E:P) + V_p$$

$$P_{t:p \text{ nonadipose}} = \frac{[P_{o:w} \times (V_{nlt} + 0.3 \times V_{pht}) + [1 \times (V_{wt} + 0.7 \times V_{pht})]]}{[P_{o:w} \times (V_{nlp} + 0.3 \times V_{php})] + [1 \times (V_{wp} + 0.7 \times V_{php})]} \times \frac{fu_p}{fu_t}$$

# Study design

Validation

- Existing available oral anti-TB formulations of bedaquiline, delamanid and rifapentine were validated in adults
- Mean simulated values from 100 virtual individuals (aged 18-60 years) were compared with available clinical data

Prediction

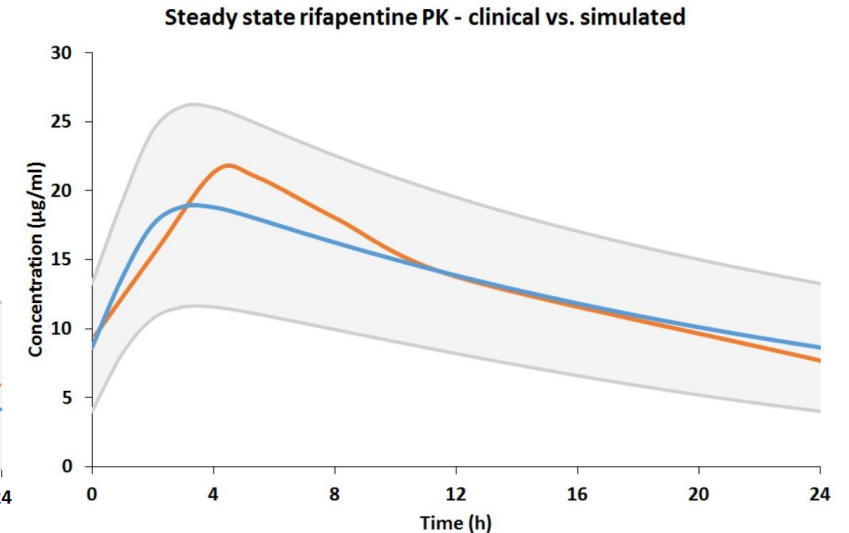

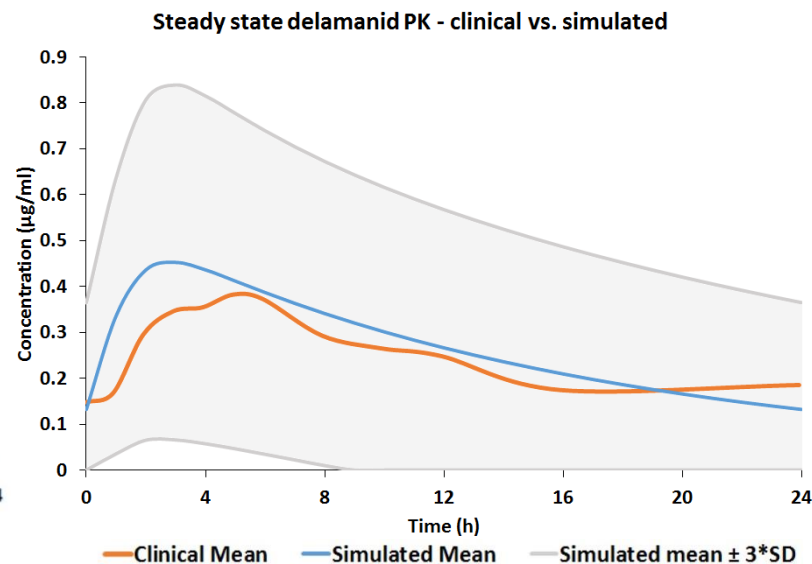

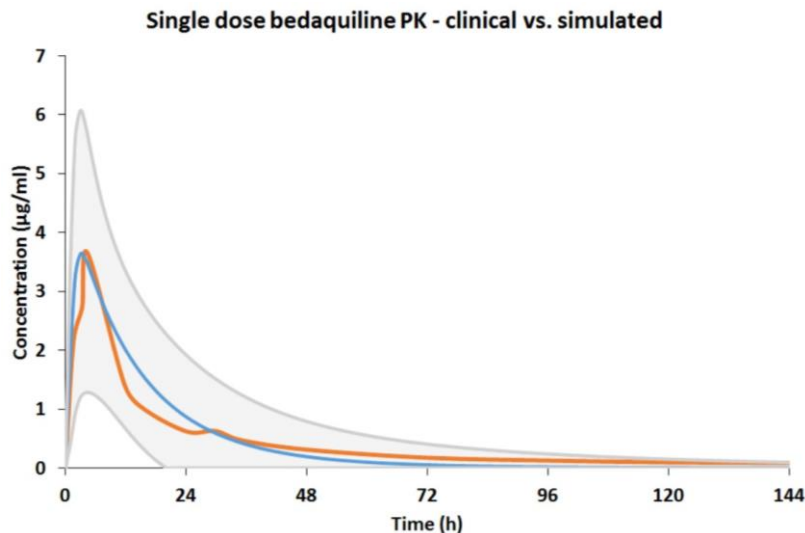

- Virtual IM depot was included in the model to simulate IM administration
- Maximum feasible human IM dose of 2000 mg was assumed for pharmacokinetic predictions in the current study
- Release rate was selected in order to obtain maximal exposure over the dosing interval

# Validation against clinical formulations

Drug	Clinical			Simulated		
	$C_{max}$ ( $\mu\text{g/ml}$ )	$C_{min}$ ( $\mu\text{g/ml}$ )	AUC ( $\mu\text{g}\cdot\text{h/ml}$ )	$C_{max}$ ( $\mu\text{g/ml}$ )	$C_{min}$ ( $\mu\text{g/ml}$ )	AUC ( $\mu\text{g}\cdot\text{h/ml}$ )
Bedaquiline (450 mg OD, single dose) <sup>1</sup>	$3.76 \pm 1.17$	-	$\ddagger 64.5 \pm 26.9$	$3.59 \pm 0.79$	-	$\ddagger 63.1 \pm 15.6$
Delamanid (300 mg OD, day 10) <sup>2</sup>	$0.41 \pm 0.05$	$0.14 \pm 0.04$	$\dagger 5.84 \pm 0.99$	$0.45 \pm 0.13$	$0.13 \pm 0.08$	$\dagger 6.57 \pm 2.31$

# Release rate optimisation

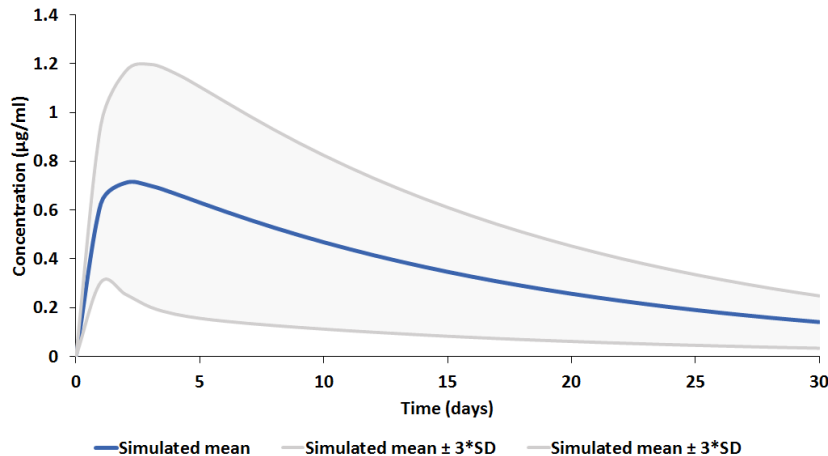

# Prediction - Summary

IM Dose – 2000 mg/30 days

IM release rate – 0.0025 h<sup>-1</sup>

Drug	AUC (Mean ± SD) (µg.h/ml)	C <sub>max</sub> (Mean ± SD) (µg/ml)	C <sub>trough</sub> (Mean ± SD) (µg/ml)	Cut-off limit (µg/ml)
Bedaquiline	271 ± 65	0.72 ± 0.16	0.14 ± 0.04	1.6 (ECOFF)
Delamanid	89 ± 16	0.23 ± 0.04	0.05 ± 0.01	0.04 (ECOFF)
Rifapentine	1639 ± 160	4.12 ± 0.38	0.88 ± 0.09	0.06 (MIC)

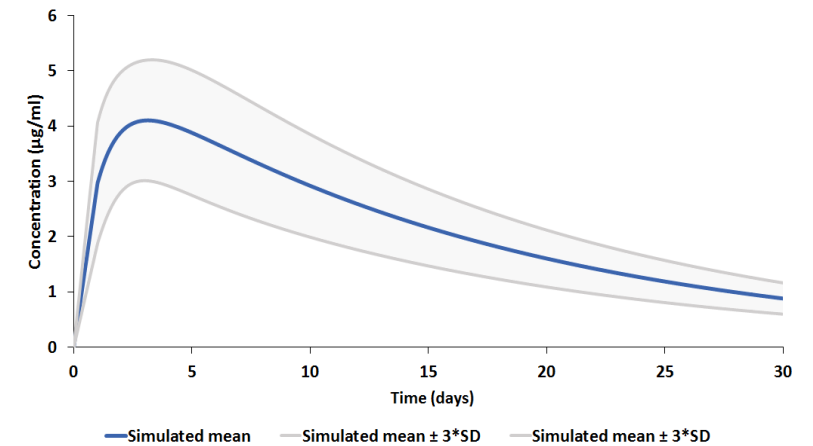

PK of single IM dose of bedaquiline

PK of single IM dose of delamanid

PK of single IM dose of rifapentine

# Limitations

- Activity of transporters can affect distribution and elimination patterns
- Drugs with high lipophilicity tend to diffuse through the lymphatic circulation rather than through blood
- The technological complexities associated with reformulation may constitute a barrier for some anti-TB agents
- Long term stability of anti-TB agents in potential long-acting formulations is unknown

# Conclusion

- This theoretical approach could assist in informing the design of long-acting formulation for IM administration of anti-TB agents
- PBPK modelling represents a predictive tool to rationalise anti-TB agent pharmacokinetics and hypothesise potential applications of long-acting anti-TB therapy
- Lack of clear pharmacodynamics cut-offs and clinical validation of alternative combinations complicates the selection of suitable long-acting candidates
- Long-acting formulations could also find potential application in the treatment of latent TB or chemoprophylaxis
