Abstract: Space is from two kinds of energy in standing waves; (1) energy with mass which is finite energy and (2) energy without mass which is infinite energy. Given light speed is equal to frequency times wavelength $C = f \lambda$ then photon half waves are twice light speed on contraction before reversal expansion at light speed. Light speed is a constant relative to mass in Special Relativity but photon half waves are twice light speed on contraction from the fundamental frequency. Infinity is half wave photon energy on contraction at twice light speed without mass-time. Standing half wave photons are oscillating as medium (ether) at twice light speed where energy is infinite; consequently, energy on reversal expansion creates mass and time in the electromagnetic field.

1. Introduction

Light speed is a constant on complete wavelengths; therefore photons are twice light speed on half waves. Photon half waves have twice the energy on contracting oscillations and energy at half oscillations on expansion where each photon have two shorter half waves within for full wavelengths. Frequency and wavelength are oscillations between electro expansion and magnetic contraction at square of the distance between fields. In Figure 1A, half waves are open-ended where anti-nodes are in the middle and nodes at ends such that each half wave is multiplying into full wavelengths. Half wave photons are infinite as standing waves without distance and mass (no point A to point B); thus, without physical time since there is no gravitation for momentum. Black-red electro photons are transverse waves perpendicular to brown-green magnetic photons. Photon half waves are twice Planck's constant on contraction having very high energy levels creating mass in a quantum cone on reversal expansion.

2. Report

The EM wave is comprised of photon energy. Figure 1B below depicts half waves on reversal expansion where mass is created from photon energy at twice light speed. Moving two half waves from center in direction Z and squaring, there are four complete green magnetic circles in the square. Moving three half waves from center and squaring, there are nine complete brown magnetic circles in the outer square and so on at the inverse-square distance from center. The square of the distance is from mass center with the four corners Z between the fields. Mass at center in the electro field Z coupled with momentum G in the magnetic field is mass with gravitation after breakout in an expanding fie cone. Black-red electro photons and brown-green magnetic photons are perpendicular to each other with black-red expanding in direction Z and brown-green magnetic photons contracting in direction G. When black-red electro photons are expanding in direction Z, then the brown-green magnetic photons are rotating as momentum in direction G with the electro photons in Z. The magnetic field photons rotate inside the electro field photons when there is a change in the fields. Brown-green magnetic half wave photons are 90° out of phase with the black-red electro half wave photons perpendicular on expansion. Expansion comes from the prior higher harmonic with two shorter half waves within each half wave photon shell as wave function. In Figure 1A, above, it should be noted that full wave magnetic photons are in phase with full wave electro photons at the nodes (center of half waves) but completely out of phase at the anti-nodes perpendicular,

In Figure 1B above, the magnetic field photons in G rotation coupled with the electro photons in Z direction needs clarity. Start with the upper left corner of the Z square to see how the G photons move from all four sides of the square that form a circle inside the black-red photons perpendicular in direction Z. Similar to Faraday's Law of induction, the magnetic field photons moving in a circle in direction G will cause a current inside the electro field photons that move in direction Z when there is a change in the fields. For an increase/decrease in amplitude of electro photons moving in direction Z, the magnetic photons will be out of phase having very weak attraction forces on the black electro positive and red electro negative. Magnetic waves in direction G rotating inside the perpendicular electro waves are the inverse square distance from mass center in the electro field. After infinite energy contracts at twice light speed on the square of distance getting shorter, the high energy photons will stop resonating and coalesce into hydrogen atoms and other gasses on breakout as reversal expansion.

From direction of arrows in Figure 1B, the black electro and brown magnetic propagate as circular and sine waves while the red electro and green magnet move only as sine waves. Quarks deep in the apex of circular cones include the black electro circular waves, the black electro sine waves and green magnetic sine waves as the proton while brown magnetic circular waves, brown magnetic sine waves and red electro sine waves are the neutron. Gluons are the amplitude of half waves and much stronger in the cone apex holding protons and neutrons together. Beta decay is interaction of black-red half waves between protons and neutrons. Note: - all half wave photons in finite energy have two shorter half waves within from the prior higher frequency after breakout from reversal expansion of half wave infinite energy. Electrons expand outwardly in the quantum cone where amplitude of red/brown electrons and black/green positrons interact with the brown-green photons. [The e coupling constant as the inverse of its square: about 137.03597 is the amplitude for a real electron to emit or absorb a real photon.][1].

Mass as finite energy is receding due to expansion in the field evidenced by the redshift and distance. Mass-energy equivalence is an equal function where mass is not the same as energy but equal to it when finite. Matter can neither be created nor destroyed because mass-energy equivalence is finite at light speed. The link between infinite and finite energy is twice light speed and a universe without a beginning is a universe without mass-time. Standing half wave photons are ether at twice light speed on contraction that permeates everything as medium. It follows from the wave nature of energy at twice light speed that nothing finite exists on contraction but for mass-time created from it on reversal expansion. Mass in the electro field already includes part of the magnetic field as subatomic gravity forces; the remaining magnetic field spectrum is light and gravity on mass, the remaining electro field spectrum not subject to light and gravity is dark energy and dark matter. [A star is formed when a large amount of gas (mostly hydrogen) starts to collapse in on itself due to its gravitational attraction.][2]. A metaphor to motion-picture theater: the screen is the universe, the pictures are the stars and galaxies and the projector is energy at twice light speed. We come from finite energy and see the moving pictures in mass-time.

3. Conclusion

Extended Equation: $E = ZG^2$ where ZG^2 is half wave photon energy on contraction before photon reversal in the EM field. This is twice Planck's constant: $E = 2(\hbar f)$ at twice light speed on contraction. Photon energy by itself can expand any distance at light speed in Special Relativity and is timeless without mass. In Einstein's $E = MC^2$ if we take mass out of the equation then E is equal to C in full wavelengths with the inverse square distance between the photon fields but in the original half wave contraction mode E is equal to $2C$ as infinite energy. Time is not another dimension but rather mass energy in the electric field driven by momentum of gravitation in the magnetic field. Everything in the expansion mode is finite energy having mass in the electric field coupled with momentum of gravitation in the magnetic field.

Gravity is equivalent to the accelerating circles G which are out of phase with mass. Gravitational forces are very weak because photon anti-node forces in the magnetic field are out of phase with anti-nodes in the electric field. When mass energy doesn't exist (0 at the nodes in the electric field at light speed), then gravity exist in the magnetic field with the full force equal to mass energy but when mass energy does exist (1 at the anti-nodes in the electric field at light speed), then gravitational force in the magnetic field is very weak out of phase with mass in the electric field. This brings to mind Heisenberg's uncertainty principle where standing position of an electron in the electric field cannot be measured simultaneously with momentum in the magnetic field. The reason is because the two fields are reciprocal at light speed. Mass as a reciprocal of gravitation is outlined as follows:

$E = M C^2$ (From photon reversal expansion in the electromagnetic field at twice light speed).

$1 = M C$ (Electro Field "C" times Magnetic Field "C" = $C^2 = 1$).

$C = \frac{1}{m}$ (C^2 or 1 applies to the square of the distance between electro and magnetic fields).

$G = \frac{1}{m}$ (Mass and Gravitation are reciprocal from out of phase full wave base photons).

Space is comprised of standing half wave photon energy that forms an electromagnetic field grid where direction Z is the electro field perpendicular to direction G magnetic field. The energy is infinite at twice light speed in half wave photons at the square of distance between fields. Standing wave infinite energy have infinite standing time as opposed to finite energy with mass having moving (physical) time from gravitational pull toward infinite time. C^2 is photon energy at light speed in the electro and magnetic fields that are totally out of phase on complete wavelengths after reversal expansion from infinite energy. When matter is created in the electro fields from energy at twice light speed on reversal expansion, distance comes into the picture at the inverse of its square between centers of mass and gravitation with light in the magnetic field. C^2 is numerically one (1) as a multiplier and offset to mass due to reciprocity and square of distance between fields. Thus: $E = M(1)$ is mass in phase at light speed.

Figure !A, show full wave base photons are in phase at the nodes (center of half waves) having the brown-green magnetic anti-nodes totally out of phase with black-red electro anti-nodes perpendicular. Given that photons have duality as a particle and as a wave function, the half wave photon is an energy particle function where the half wave electro photons are perpendicular to the magnetic half wave photons rotating inside the electro photons. These half wave particle shells are 90° out of phase perpendicular between the electro and magnetic fields and are responsible for the physical (visible) universe. Inside all of this, inside all the half wave particle shells are two shorter half **wave** photons within the half wave particle shells coming from higher frequency half wave photons on expansion from half wave infinite standing energy. This gives the half wave particle shells the wave function in complete wavelengths. It's the full wavelength function behind the scenes that is responsible for the reciprocity of the two fields 180° out of phase where the electro field and magnetic field offset each other. This includes mass energy and gravitation in the fields. The wave function is responsible for the intermittent existence of mass in the electro field where gravitation is weakest in the magnetic field and vice versa when mass doesn't exist; gravitation is strongest in the magnetic field out of phase in full wavelengths at light speed. What we see is what we get in half wave (half life) particle shells, what we don't see is the universe without mass totally out of phase in full wavelengths at light speed. Mass in the electro field and acceleration in the magnetic field are reciprocal and inversely proportional to the changes between them with the same net force. Mass in the electro field curves the magnetic field in general relativity and mass expanding with the magnetic field is mass-time. [Space-time in general relativity is not flat but curved by the distribution of mass and energy in it.][3].

Standing half wave photons at twice light speed on contraction is infinite energy in a quadrant grid (EM Field) without mass and time. The photon half waves (quanta) on contraction will build-up a very strong force from the square of the distance getting shorter reaching a point of reversal expansion in full wave base photons at light speed.

Electromagnetic field waves on expansion as mass and time.

Mass in the electro field with light and gravitation in the magnetic field are created from photons at twice light speed on expansion from infinite energy.

In summary: After half wave photons at twice light speed reverse and expand in full wavelengths at light speed, photons in the electro field will decrease in velocity on expansion, become heavy and dense taking on properties of mass as protons, neutrons and electrons while photons in the magnetic field as light energy and gravitation on contraction will not become mass but act as an offset to it for equilibrium in the form of gravitation in the fields. Photons provide all the different elements due to momentum, frequency and wavelength in the electro field on expansion and magnetic field on contraction. Magnetic photon waves can expand to any distance at light speed because of frequency and wavelength but when mass is created then momentum is born along with distance and time. Energy expands in the electro field in full wavelengths as mass and contracts in the magnetic field as light and gravitational pull toward higher frequency infinite energy. Reciprocity between electro and magnetic fields in phase and totally out of phase define existence and non-existence of mass at light speed. Although physical time does not exist without mass; twice light speed is a multiple of the constant C to tie back into MC^2 for time; however, energy can have any multiple times light speed for any multiple universes without mass and physical time. The moving pictures at light speed are intermittent changes in physical time for finite energy coming from infinite energy as standing time. The fundamental frequency of standing waves in infinite energy is connected to everything finite as matter and time where the frequency pictures at light speed are past, present and future.
