Abstract

This paper discusses the properties of the *quite de* construction in the Baie Sainte-Marie, Nova Scotia variety of Acadian French in examples such as *le/un quite de souper* ‘quite the/a supper’ which have a hyperbolic connotation. Unlike epithet nouns and other French binominals (and Romance more generally), we argue that this Acadian French construction contains a complex DP with a unique N with an expanded left nominal periphery (cf. Giusti 2005, 2006, 2012). In order to unify its syntactic and semantic properties, we propose an analysis where [_{Adv} *quite*] is a scalar Focus head (following Kayne’s 1998 treatment of scalar *only*), with a null M(easurement) Op(erator) (Rett 2008, 2011) in its specifier. This M-OP is associated with a degree argument (i.e. N) bound by existential closure, which forces its linearization within the predicate domain (cf. Diesing 1992). Lastly, we show that *de* in the AF ‘quite de’ construction cannot be construed as a linker (pace den Dikken 2004, 2006) or as a P category (pace Kayne 1994), but it is best analysed as a nominal functor (cf. Ihsane 2013) at the Comp-Infl interface whose role is to recategorize a referential DP into a property denoting DP.

Keywords: *quite de*; binominal constructions; *en*-cliticization; scalar Focus; Acadian French.

^{*} We thank Gary R. Butler for granting us access to his Grosses Coques, Nova Scotia Sociolinguistic Corpus, and Philip Comeau for verifying various Baie Sainte-Marie Acadian data for us. All errors are our own.

3. Preliminary properties: Agreement, modification, and Det type	6. Conclusions References

1. Introduction

The Baie Sainte-Marie, Nova Scotia variety of Acadian French (henceforth, AF) has borrowed the English degree modifier *quite* in constructions such as (1):¹

- (1) a. Vous aviez fait [une quite *(de) visite].
 ‘You had had quite a visit.’
 (King 2013: 102)
- b. C’était [une quite *(de) Carole].
 ‘Carole was quite something.’

Semantically, the presence of *quite* emphatically evaluates the lexical noun, on par with English. Syntactically, unlike in English, where *quite* is an adverbial modifier targeting a variety of XPs as in [*quite* [_{AdjP} *expensive*]], [*quite* [_{AdvP} *frankly*]], [*quite* [_{DP} *the story*]], [*quite* [_{PP} *out of the question*]], in Acadian French, *quite* is constrained to constructions as in (1) where it must follow the Determiner and must precede *de*.

To the best of our knowledge, this is the only variety of French with such a construction, arguably induced by contact with English.² Consequently, its syntax begs clarification, especially since the obligatory presence of *de* in (1) points to well-known complex nominal constructions (i.e. binominal constructions) available to most French dialects and to Romance more generally.

This paper discusses the properties of the *quite de* construction in relationship to binominal constructions and argues against such an analysis for the Acadian French variety. Rather, we show that, in order to unify its syntax and its

¹ We use the following abbreviations in this paper: ‘AF’ Acadian French, ‘FEM’ feminine gender, ‘MASC’ masculine gender, ‘SG’ singular number, ‘PL’ plural number, ‘DE’ uncategorized *de*.

² Acadian French in general is marked by both conservatism, i.e. retention of vernacular features of French long lost from most spoken French varieties, and innovation, typically but not exclusively in terms of borrowing from English (see King 2000, 2013 for discussion). The phenomenon discussed here is expected to occur only in those Acadian regions of Atlantic Canada where there has been longstanding contact with English, such as Baie Sainte-Marie. For instance, while Emilie LeBlanc (p.c.) reports that part of the pattern described here is also found in southeast New Brunswick Acadian French, it is clearly not found in Acadian regions where there is less intense contact, such as northeast New Brunswick, or where contact has been of shorter duration, such as western Newfoundland.

semantics, *quite* in AF must be analysed as a scalar Focus head in an expanded left periphery of a uni-nominal, albeit complex, DP.

The paper is organized as follows: having concluded the introduction, section 2 discusses *quite de* in AF and compares it to binominal constructions in French more generally; section 3 focuses on some of its preliminary syntactic properties, such as agreement, modification and D type; section 4 engages with and dismisses previous analyses, while section 5 unifies the syntax and semantics of ‘quite de’ under the scalar Focus proposal and provides further support for the current analysis from exclamatives and other evaluatives. Section 6 concludes the paper.

2. Introducing *quite de* and binominal constructions

As King (2013: 102) points out, the data in (1) bear a strong resemblance to the use of French epithet nouns, exemplified by *un espèce de cochon* ‘a real pig’, literally, ‘a sort of pig’ and *un putain de livre* ‘a bloody book’, literally, ‘a whore of book’. From a semantic point of view, both *quite de* constructions and epithet nouns are strongly evaluative, having a hyperbolic connotation. Crucially, *quite* has lost its original lexical meaning (< Anglo-Norman ‘without opposition’, c. 1225, OED), indicating instead something akin to “extreme degree”, an issue we revisit in Section 4.

The syntax behind this construction, however, is less clear. Epithet nouns are instances of binominal constructions of the *(Det) N1 de N2* type, of which French instantiates several types, see (2), on par with Romance more generally (cf. Cornilescu & Giurgea 2013, den Dikken 1998, 2006, Doetjes & Rooryck 2001, Español-Echevarría 1996, Hulk & Tellier 2000, Kayne 1975, 1994, Milner 1978, Tănase-Dogaru 2013, inter alia):

- (2)
- a. partitive: *un verre d’eau* ‘a glass of water’, *une bouteille de vin* ‘a bottle of wine’ and also, complex nominals like, *beaucoup/pou de livres* ‘many/few of the books’, with a proportional reading;
 - b. quantitative: *une montagne de livres* ‘a mountain of books’, and also, *beaucoup/pou de livres* ‘many/few books’, with a cardinal reading (no part-whole relation);
 - c. possessive: *la soeur de Marie* ‘Mary’s sister’
 - d. qualitative: *un bijou de voiture* ‘a jewel of a car’, *un ange d’enfant* ‘an angel of a child’

Interestingly, AF allows constructions equivalent to (2a-c), see (3a-c), but not the qualitative (2d) – though the latter is fine with some Adjectives (e.g. *une drôle d’affaire* ‘a strange story’).

- (3) a. partitive: C'est un meilleur *morceau de terre*.
'It's a better piece of land'
b. quantitative: Il y avait *beaucoup de brume*.
'There was a lot of mist'
c. possessive: la soeur à Marie
'Mary's sister'

Unlike AF, other varieties of Canadian French (i.e. Laurentian French), however, do allow evaluative (*Det*) *N1 de N2 constructions*, as illustrated by: *un criss de livre* 'a bloody book' (literally, 'a Christ of book'), *des hosties de questions* 'some fucking questions' (literally, 'some hosts of questions'), from Drescher (2009). As both are semantically evaluative, it looks like AF has replaced the epithet N construction with the *quite de* construction. The question is whether the initial Adverb status of English *quite* is preserved in AF or whether we are dealing with a qualitative binominal construction, in which case *quite* now has nominal properties. Or perhaps something else altogether is going on. In order to tease these possibilities apart, one has to investigate the properties of the AF *quite de* construction. In the next section we start by looking at some preliminary properties.

3. Preliminary properties: Agreement, modification, and Det type

In this section, we explore phi-feature agreement, modification possibilities and determiner type associated with the complex nominal of the AF *quite de* construction.

3.1. Phi-agreement

Insofar as French qualitative binominals are concerned, Hulk & Tellier (2000) show that agreement is variable, in that it can be with either N1 or with N2 (i.e. the N preceding *de* or the N following *de*, respectively). Crucially, this choice is dependent on the amount of semantics associated with N1 (Doetjes & Rooryck 2001); consider (4), where the head/agreeing N is underlined:

- (4) a. Ton phénomène de file est bien distraite.
your_{masc} phenomenon_{masc} of daughter is quite absent-minded_(fem)
'Your phenomenon of a daughter is quite absent-minded.'
(Hulk & Tellier 2000: 36 (3a))
b. Ce bijou d'église romane a été reconstruit(*e).
that jewel_{masc} of-church_{fem} roman has been rebuilt_{masc / *fem}
'That jewel of roman church was rebuilt.'
(Doetjes & Rooryck 2001: 2(3b))

In (4a), *phénomène* 'phenomenon' has lost its original meaning, so fails to trigger agreement, while in (4b), *bijou* 'jewel' retains its semantics so it triggers agreement. Compare also the epithet use of *espèce* in *un_{masc} espèce_{fem} de cochon_{masc}* 'a real pig' with its literal use in *une_{fem} espèce_{fem} de poisson_{masc}* 'a species of fish': it is only in the latter case that *espèce* determines the gender of

the entire DP phrase, as evidenced by the feminine indefinite determiner. In sum, the lexical heavy-weight between N1 and N2 determines the properties of the entire DP, so it becomes its head.

The AF data in (1a,b) show feminine gender agreement while those in (5a,b) show masculine agreement. (5c) shows plural agreement.

- (5) a. J'avons eu [un_{masc} quite de souper_{masc}]. (AF)
 'We had quite a supper.'
 b. C'est [un_{masc} quite de Paul_{masc}]. (AF)
 'Paul is quite something.'
 c. Ça paraît que ça va être [des_{pl} quite de nocces_{pl}]. (AF)
 'It seems that it is going to be quite a/some wedding.'

Crucially, the data in (1) and (5) show that *quite* does not interfere with the gender of the complex DP; rather it is always N2 that determines the phi-features (i.e. gender and number) of these evaluative DP constructions in AF. This is unsurprising as *quite* is semantically bleached and likely does not qualify as an N1 or we would expect to see AF constructions of the type in (2d) more productively. Modification facts discussed below equally rule out *quite* as an N category.

3.2. Modification

Hulk & Tellier (2000) point out that French qualitative binominals allow modification on both N1 and N2, as seen in (6), where we also bracket the relevant constituents:

- (6) cet [*affreux* jojo] de [mari *de ma sœur*]
 'this nasty sod of a husband of my sister'
 (Hulk & Tellier 2000: 34)

However, unlike qualitative binominals in standard French, the data in (7) show that N2 but not *quite* may be modified by an adjective in AF, regardless of number properties.

- (7) a. J'avons eu un [(**bon*) quite] de [bon souper]. (AF)
 'We had quite a good supper.'
 b. J'avons eu des [(**bons*) quite] de [bons soupers]. (AF)
 'We had quite good suppers.'

This confirms that *quite* in AF is not an N, but rather an adverb on par with English, and that the *quite de* construction in AF is not binominal, but rather contains a single N (i.e. the equivalent of N2 of otherwise legitimate binominal constructions in Romance).

3.3. *Det type*

So far we have seen that this complex DP allows for variable phi-features. This subsection further shows that it allows for variable definiteness. In (1) and (5a-b), the DP containing *quite de* is indefinite, but in (5c) it is definite. (8) further shows that both (in)definite options are palatable.

- (8) a. du quite de souper (AF)
of.the_{masc} quite DE dinner_{masc}
b. le quite de souper (AF)
the_{masc} quite DE dinner_{masc}

Unsurprisingly the (in)definiteness options correlate with further semantic asymmetries. In particular, (9) shows that, in the appropriate contexts, the indefinite correlates with either an entity or an event reading while the definite forces an entity reading (Comeau, p.c.).

- (9) a. Ça c'était *un* quite de souper. (AF)
‘That was quite a supper.’
(entity or event reading)
b. Ça c'était *du* quite de souper. (AF)
‘That was quite the supper.’
(speaking only of the food itself – i.e. entity reading)

Having covered some of the preliminary properties of this complex DP in AF, we next survey two of the major previous analyses proposed for qualitative binominals in French/Romance and see what light they shed with respect to the *quite de* construction in AF.

4. Previous analyses and beyond

This section discusses the small clause analysis proposed for qualitative binominals in Romance (primarily Kayne 1994 and den Dikken 2006) as well as Doetjes & Rooryck’s expanded DP analysis. Crucially, the main issue is to try and determine what the syntactic status of *de* is in these nominals.

4.1 *Small Clauses: subject-predicate structures*

For Kayne (1994), *de* in qualitatives, as in possessives, lexicalizes a D/P head and is comparable to a prepositional complementizer, as shown in (10):

- (10) cet [_{D/PP} [_{NP} imbécile]_j] [_{de} [_{IP} Jean I [_e]_j] ...
(Kayne 1994: 106 (108))

(10) also captures the fact that in these binominal constructions the structure contains a subject-predicate small clause in which the predicate undergoes inversion.

Based on their different semantics, a fact arguably first observed by Napoli (1989), Den Dikken (2006) splits qualitative binominal phrases into two types: (i) comparative, as in (11a), and (ii) attributive, as in (11b).

- (11) a. a jewel of a village
(den Dikken 2006: 162 (3a))
b. an idiot of a doctor
(den Dikken 2006: 162 (3b))

The author points out that, in (11a), a comparison is drawn between *a village* and *a jewel* (i.e. ‘the village is like a jewel’), while for (11b), the more salient interpretation is one where *idiot* is a property ascribed to *doctor*, on par with attributive constructions like *big for a butterfly*, which are analysed as having a predicate-specifier structure. In particular, in attributive constructions, N1 (Milner’s 1978 *noms de qualité* ‘quality nouns’) and N2 are base-generated in their surface word order, with the predicate nominal (i.e. *idiot* in (11b)) preceding its subject. For (11a), on the other hand, den Dikken argues for an underlying canonical predicate-complement structure, with predicate inversion (i.e. *a village* is base-generated in the specifier of the predicate phrase, with *jewel*, the nominal predicate, as its complement). Furthermore, in den Dikken’s (2006) analysis, all instances of subject-predicate relationships are mediated by a ‘relator’ (with predicate inversion structures also having a ‘linker’). In French qualitative binominals, the relator is *de* (i.e. a nominal copula). In sum, Den Dikken argues that the non-equivalent semantics of these binominals points to two different syntactic structures (predicate-specifier, versus predicate-complement), with N1 being the predicate in both cases.

Importantly, predicate inversion (i.e. the comparative type) seems to trigger an emphatic reading, a situation mirrored in other Romance languages. For example, in Romanian, comparative clauses directly specifying degree, normally appear after the adjective, as in (12a); however, when preposed, they yield an emphatic reading and trigger *de* ‘of’ insertion, as in (12b):

- (12) a. înalt cât casa
tall how house-the
(Cornilescu & Giurgea 2013: 435 (236))
b. cât casa de înalt
how house-the DE tall
‘as tall as the house’
(Cornilescu & Giurgea 2013: 435 (237))

Given the emphatic semantics associated with the *quite de* construction in AF, such an analysis would be very tempting. However, the comparative binominal analysis is untenable on at least two grounds: (i) there is no comparison between *quite* and ‘N2’ (e.g. *visite* in (1a)), as there is between *jewel* and *village* in (11a) or *bijou* and *voiture* in (2d), and (ii) examples like (13) rule out a predicative analysis for *quite*.

- (13) *La visite est (une) quite.
 the_{fem} visit is a_{fem} quite

Perhaps unsurprisingly, this situation resembles that of epithet nouns, which also rule out a comparative reading. Doetjes & Rooryck (2001) specifically show that if N1 has lost its original lexical meaning, the binominal construction excludes a comparative reading. This is shown in (14).

- (14) a. *The quality of your daughter is such that she resembles a phenomenon.
 b. The quality of the church is such that it resembles a jewel.
 (Doetjes & Rooryck 2001: 2(6a-b))

Note that the quantitative construction with *beaucoup/peu de* also resists being paraphrased as a comparison, as seen in (15):

- (15) *The quantity of books is such that it resembles a lot.
 (Doetjes & Rooryck 2001: 2 (4b))

So, *quite de* constructions in AF resemble not only epithet Ns, but also quantitatives with *beaucoup/peu* (i.e. ‘pure degree’ constructions, in the sense of Doetjes & Rooryck 2001). And, interestingly, as with *quite de* in AF, these quantitative constructions also force agreement with N2 rather than with N1; compare (16a)-(16b) – underlining our own:

- (16) a. Beaucoup de livres sont /*est tombé(s).
 a lot of books are / is fallen
 (Doetjes & Rooryck 2001: 1 (2a))
 b. Une montagne de livres *sont/est tombée.
 a mountain of books are / is fallen
 (Doetjes & Rooryck 2001: 1 (2b))

In sum, in this section we have shown that a subject-predicate analysis of the type proposed in Kayne (1994) and den Dikken (2006) is difficult to maintain for *quite de* in AF, but that this construction shares properties with both epithet nouns and the *beaucoup/peu de* construction. The next section explores the possibility that, rather than a verbal functor, *de* is in fact a nominal functor.

4.2 Expanded Nominals: *de* as a nominal functor

Doetjes & Rooryck (2001) argue against predicate inversion for ‘pure degree’ binominals whether quantificational or qualificational. Rather, they propose (17), with N1 moved to Spec,EvalP of a nominal phrase where *de* is viewed as a nominal functor:³

³ Note that Hulk & Tellier (2000) also engage with this line of thought. While these authors maintain a small clause analysis (at least in spirit) for binominals, they argue for *de* as a functor with lexical features in possessives, where it incorporates a P, and operator features in qualitatives, where it incorporates a Q.

- (17) a. [EvalP [ce phénomène] [Eval [DP ____ [D de [NP fille]]]]]
 b. [EvalP [beaucoup] [Eval [DP ____ [D de [NP livres]]]]]
 (based on Doetjes & Rooryck 2001: 6 (20))

The structure in (17) is appealing given the presence of an adverbial Evaluative head (à la Cinque 1999) and the potential of AF *quite* as an adverb. In particular, since in AF *quite* lacks both nominal and predicative properties and is derived from the English [Adv *quite*], its status as an adverbial Evaluative head seems straightforward. Nonetheless, a structure of the type in (17) is likely incorrect given the *en*-cliticization properties of ‘quite de’ nominals in AF.

Kayne (1975, 1994) argues that *en*-replacement is equivalent to a [PP de NP] (i.e. a *pro* PP), given that it substitutes not only for complements to verbs, but also substitute for adjectives and nouns. Interestingly, while ‘pure degree’ binominals rule out *en*-cliticization, as seen for qualitative binominals in (18) and as expected under a structural analysis of the type in (17), the *quite de* construction in AF does not.

- (18) a. *Il *en* est un espèce de cochon.
 he of-it is a type of pig
 b. *Nous *en* avons trouvé une saleté de moustique dans la soupe.
 we of-it have found a dirt of bug in the soup
 (adapted from Hulk & Tellier 2000: 41 (16))

(19), on the other hand, shows that *en*-cliticization is grammatical with evaluative *quite* in AF, a situation reminiscent of French partitives, see (20), possessives, see (21), and quantitative binominals, see (22), as is well known (e.g. Kayne 1975, 1994, Ihsane 2013, inter alia).

- (19) a. Elle *en* contait une quite d’histoire. (AF)
 ‘She told quite the one.’
 b. Marie là, ç’*en* est une quite de Marie, hein? (AF)
 ‘Marie, she’s quite the one, isn’t she?’
 c. Ils *en* contiont des quite d’histoires. (AF)
 ‘They told quite the ones.’
- (20) a. Il *en* a acheté une douzaine de pommes.
 ‘She bought a dozen (of them).’
 b. Elle *en* a lu beaucoup des livres.
 ‘She read a lot of them.’ (i.e. books)
- (21) Bien sûr que je m’*en* souviens de mon grand-père.
 ‘Of course I remember him.’ (i.e. my grand-father)
- (22) J’*en* ai lu beaucoup/peu de livres.
 ‘I have read many/few.’ (i.e. books)

The *en*-cliticization property of our construction further rules out any structural similarities with qualitative/evaluative epithet binominals and dismisses

Doetjes & Rooryck's (2001) analysis suggested in (17). If Kayne's PP equivalence analysis for *en*-replacement were correct, one possibility would be to assume that *quite* in AF modifies or is combined with a PP, where *de* is a preposition rather than a nominal functor. However, the PP analysis is problematic (pace Kayne) given that in partitives of the type in (20a) and the quantitatives in (22) no determiner occurs after *de*. Arguably, Ihsane's (2013) analysis, which proposes that, in addition to [PP *de* NP], *en* may replace subparts of nominal structure (i.e. non-referential domains) is better equipped to capture all the French facts.

In the next section we explore some of Ihsane's (2013) tests with a view at trying to establish whether *de* in AF is best viewed as a P or as a functional nominal head (since we have established that it cannot be verbal in nature).

4.3. On the status of *de* in AF 'quite *de*' constructions

Ihsane (2013) looks at extraction facts and presence versus absence of a determiner in order to decide on the status of *de*. In particular, since extraction out of a PP is generally not possible (arguably because these are phasal domains, Citko 2014 and references therein), in (23a), *deux livres* 'two books' and *beaucoup de livres* 'a lot of books' do not involve PPs since *de Zola* 'of Zola' can be felicitously extracted out of the '*de* NP' domain. Conversely, in (23b), *deux des livres* 'two of.the.pl books' and *beaucoup des livres* 'a lot of.the.pl books' do involve PPs as extraction is ruled out.

- (23) a. C'est **de Zola** que j'ai lu deux/beaucoup de livres ~~de Zola~~.
 it-is of Zola that I have read two / a.lot of books
 (adapted from Ihsane 2013: 235, (46a, c))
- b. *C'est **de Zola** que j'ai lu deux des / beaucoup des
 it-is of Zola that I-have read two of.the.pl a.lot of.the.pl
 livres ~~de Zola~~.
 books
 (adapted from Ihsane 2013: 235, (47a, b))

In addition, a determiner follows *de* in (23b) but not in (23a). Since P subcategorizes for determiners, *de* in quantitative constructions, as in (23a), cannot be a P. Rather, in such cases, it is a functional head in the nominal Inflectional domain.

Replicating these tests for the AF *quite de* construction, we get the following results. First, the data in (24) show that extraction is ruled out.

- (24) a. J'ai eu une quite de soupe aux choux. (AF)
 'I had quite the cabbage soup.'
- b. *C'est aux choux que j'ai eu un quite de soupe ~~aux choux~~. (AF)
 '*It's cabbage that I had quite the ~~eabbage~~ soup.'

However, we argue that the ungrammaticality of (24b) is orthogonal to the PP facts. In particular, while extraction is clearly not possible, it does not immediately follow that *de* in these AF constructions is a P. If that were the case,

one would expect co-occurrence with a determiner, but (25) shows that to be ruled out.

- (25) a. *Ça paraît que ça va être [des quite *des noces*]. (AF)
 Intended: ‘It seems that it is going to be quite the wedding.’
 b. Vous aviez fait [une quite *de* (**la*)/?*d’une* visite]. (AF)
 Intended: ‘You had had quite the/a visit.’

Both plural and singular definite determiners, in (25a) and (25b) respectively, are impossible with *quite de* in AF, while judgments are less categorical for *un(e)* ‘a’ in (25b). Following Hulk & Tellier (2001: 43) who show that in Dutch and English, *een* ‘a’ and *a*, are permissible with qualitative binominals (e.g. *a hell of a man*), but argue that this is not the indefinite article but an affective operator lacking phi-features, we assume that the same holds for the AF *quite de* construction. This, in effect, rules out P status of *de* here.

Having ruled out the P status of *de* based on the impossibility of a determiner, we need to find an alternate account for the facts in (24b). We propose instead an explanation based on focus intervention effects. Specifically, (24b) contains a cleft and French (including AF) uses clefts as a (contrastive) focusing strategy, as seen in (26).

- (26) C’est à Marie que j’ai donné le livre. (AF)
 ‘It’s to Mary that I gave the book.’ (not to someone else)

Since in Section 4 we argue that *quite* is involved in scalar focus in the AF *quite de* construction, (24b) is independently ruled out by the impossibility of having two simultaneous operator foci.

In sum, N2 must be a bare NP in *quite de* constructions, on par with qualitative binominals in French (Hulk & Tellier 2001) and *beaucoup/peu de* constructions. Furthermore, since only referential nominals (Chomsky 1981) - i.e. DP (but not NP) - need Case (Kayne 1999) - *de* cannot be assumed to be a case-assigner in these constructions in either standard or Acadian French (pace Jones 1996, Cardinaletti & Giusti 2006). Rather, Ihsane (2008: 168) argues that, in standard French, its function is to indicate N2 as a *property/kind/category*, rather than an object, on par with the Indo-European genitive it has replaced. While we do not take this to be its function in the AF *quite de* construction, we do follow Ihsane in concluding that it is a functional head in the nominal domain.

4.4. Summing up syntactic properties

Before summing up, there is one last syntactic property that is worthy of mention. In particular, as shown in (27), the AF *quite de* construction cannot occur in preverbal subject position in either the active or the passive voice.

- (27) a. *Des quite d’enfants ont arrivés. (active) (AF)
 of.the quite DE-children have arrived
 b. *Une quite de visite a été fait par mes amis. (passive)(AF)
 a quite DE visit has been made by my friends

The constructions in (27) can, however, be salvaged via clefting, as seen in (28). Crucially what clefting does is reposition the *quite de* construction within the predicate domain.

- (28) a. *C'est des quite d'enfants qu'avont arrivés.* (AF)
 'It's quite the kids that have arrived.'
 b. *C'est une quite de visite qu'a été fait par mes amis.* (AF)
 'It's quite the visit that my friends made.'

In sum, the *quite de* in AF is constrained to a vP-internal position. Den Dikken (p.c.) points out that the English *quite the* construction is equally postverbally constrained, which is unsurprising given their similar extreme degree semantics. While the same linearization requirements are true of quantitatives like *beaucoup/peu de* (Ihsane 2013), we point out that this is likely due to their semantics of indefinite quantity (which also explains their obligatory cardinal reading), rather than their syntactic similarity to evaluatives (i.e. lack of a P de and subcategorization for a bare NP).

In sum, the properties discussed so far are represented in Table 1. Properties for quantitative and qualitative binominals hold for standard French. Undiscussed (and not immediately relevant properties) are represented via a dash (i.e. '-').

Table 1

In Sum	AF <i>quite de</i>	'pure degree' quantitatives: <i>beaucoup/peu de</i>	'pure degree' qualitatives/epithet Ns
N2 phi-agreement	√	√	√
bare N2	√	√	√
de status	nominal	nominal (Ihsane 2008, 2013)	nominal (Doetjes & Rooryck 2001)
en-cliticization	√	√	*
obligatory in post-verbal position	√	(√)	—
PP extraction	*	√	—

Crucially, Table 1 shows that the AF *quite de* construction differs syntactically from both types of French binominals under discussion. This warrants a novel syntactic representation for the AF *quite de* construction – an issue we expand on in the next section.

5. Unifying syntactic and semantic properties

This section unifies the syntax and semantics of *quite de* constructions in AF by proposing an account reliant on the presence of a scalar Focus projection in the left periphery of a complex nominal. This analysis is further supported by the behaviour of exclamatives and other AF evaluatives.

5.1. Quite as Focus in an expanded nominal left periphery

In her discussion of English *quite*, Diehl (2005: 15) points out that in expressions like *quite a memory*, *quite* is used as a focusing strategy to emphasize high degree linked to *memory*, while at the same time enhancing the positive evaluation that is implied.⁴ We have seen that the same is true for *quite de* in AF.

In order to accommodate its semantics, we propose that *quite* in the AF *quite de* construction instantiates *scalar focus* measuring extreme degree. According to Traugott (2006), scalar focus modifiers (e.g. *even*, *only*) involve the speaker's assessment and evaluation of intensity, position on a scale, ordering of alternates, and so on. Krifka (2007) also argues that scalar focus alternatives are ordered, with the focus denotation being the least or the greatest element.⁵

In order to accommodate its syntax, we further capitalize on work by Giusti (2005, 2006, 2012) who proposes that DPs have left peripheries hosting TopP and FocP on par with clauses, with D equivalent to Force and 'd' equivalent to Fin, as seen in (29), which mimics Rizzi's (1997, et seq.) split CP.

(29) DP > TopP* > FocP > TopP* > dP (Giusti 2005: 35(28b))

However, the association of [_{Adv} *quite*] in AF with the domain of Focus in (29) still leaves open a number of questions. In particular, we have to determine whether this item resides in the head or specifier position of the Focus projection bearing the [scalar] feature. In addition, we need to fine-grain the category(c)al status of *de* in our AF construction: while section 4.3 establishes that it is not a P but rather a nominal functor, the introduction of the split left-periphery in (29) begs clarification as to whether it is an Infl or a C element.

5.1.1. *Quite* as a Focus [SCALAR] head

There is both conceptual and empirical support for treating the AF [_{Adv} *quite*] as a Focus head rather than an adverbial operator occupying Spec,FocP.

First, Kayne (1998) has already argued for treating *only*, another scalar focus item according to Traugott (2006), as a Focus head. Second, *quite* itself does not have a semantic value equivalent to "highest degree", so its status as an operator would not be semantically justified. However, since Focus heads are present in the derivation to accommodate an operator, the question arises as to what type of operator would be at stake in these AF constructions. We turn here to

⁴ See also Quirk et al (1985).

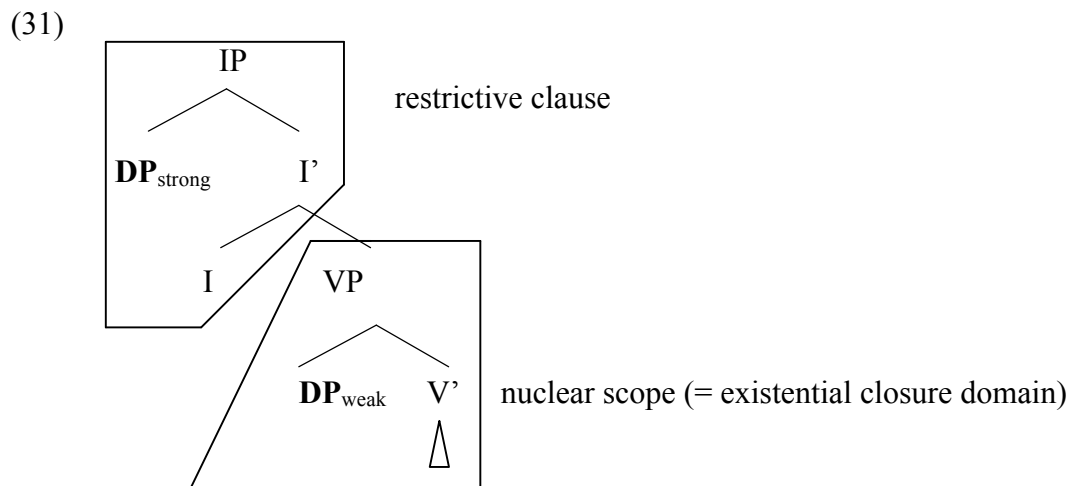

⁵ Note that, in this respect, qualitative binominals are semantically distinct as these do not involve "a high degree" (Hulk & Tellier 2000). While the latter clearly express the speaker's strong evaluation of N2, unlike *quite de* in AF, they are not scalar (i.e. they do not involve a scale).

Rett's (2008, 2011) null "M(easurement) operator" (henceforth, M-OP), essentially "a function from entities to degrees along some scale which may or may not be a quantity scale" (Rett 2011: 425). Basically, M-OP can occur freely with entities that can be measured and accounts for the fact that dimensions of measurement vary based on the noun involved and on context; we argue that this is what occupies the Spec,FocP of the AF *quite de* construction.

Empirical support for the above claims comes from at least the following two facts: (i) the inability of [_{Adv} *quite*] to combine with adverbial modification, which is suspicious if this were an XP in Spec,FocP, and (ii) linearization requirements of the construction more generally. The former is illustrated in (30), while the latter is discussed below.

- (30) C'est (vraiment) un (*vraiment) quite de souper. (AF)
 it-is really a really quite DE dinner
 'It was really quite a dinner.'

The presence of M-OP in Spec,FocP can also account for the otherwise mysterious postverbal linearization demands of this construction. In particular, Rett (2011) argues that the degree argument introduced by M-OP is bound by existential closure. Since, following Diesing's Mapping Hypothesis (1992), clausal mapping reduces existential closure to the predicate domain (her VP, currently vP), as in (31), the postverbal requirement of the *quite de* DP shown in section 4.4 follows in a straightforward manner once we take into account that in Romance the verb raises to Infl (Emonds 1978).

In sum, we conclude that the *quite de* construction in AF contains an expanded left-periphery with a Focus [SCALAR] domain hosting an M-OP in its specifier and *quite* in its head position. Lastly, in the next section, we revisit the status of *de* as an Infl or a C nominal element.

5.1.2. *De* as nominal Infl moved to d/Prop(erty)

In their discussion of standard French complex noun phrases of the type *une pizza de chaude* 'a hot pizza', den Dikken & Singhapreecha (2004) convincingly show that *chaude* 'hot' instantiates old information, while the entire DP receives a

-
- (34) a. C'est [une godam de grosse bus]. (AF)
 'It's a God damn big bus.'
- b. J'avais [un (*gros) godam de gros fusil] dans les bras. (AF)
 'I had a God damn big rifle in my arms.'
- c. Tu **en** as pas mangé [un godam ~~de~~ pizza]. (AF)
 'You didn't eat a God damn one.'

Lastly, note that *godam* also appears in the Grosses Coques corpus as an exclamative/interjection, as in (33).

- (33) a. Godam! Tu l'as vu, toi? (AF)
 'God damn, did you see it?'
- b. Godam de souris chauve! (AF)
 'God damn bat!'

This is unsurprising since exclamatives equally express that a speaker's expectation has been surpassed (either positively, hence, flattery, or negatively, hence, insults) – Portner & Zanutini (2000), Rett (2011), *inter alia*.

In sum, unlike standard French and some other varieties of Canadian French (i.e. Laurentian/Québec French), the Baie Sainte-Marie Acadian French variety lacks the qualitative binominal construction of the (*Det*) *N1 de N2* type but makes use instead of a complex nominal construction borrowing lexemes from English to denote evaluative semantics.

6. Conclusions

This paper sets out to explore the properties of the *quite de* construction in the Baie Sainte-Marie Nova Scotia variety of Acadian French. Unlike evaluative binominals of other French varieties (and Romance more generally), the AF construction contains a complex DP with a unique N (the 'N2' of binominals) and an expanded left nominal periphery (cf. Giusti 2005, 2006, 2012).

In order to unify both its specific syntax and its hyperbolic semantics, we argued for an analysis which views [_{Adv} *quite*] in this AF construction as an instance of scalar Focus (i.e. Focus [SCALAR] head), with an M- OP in its specifier. This M- OP is associated with a degree argument (i.e. N2) bound by existential closure, the latter property fixing the construction within the predicate domain (cf. Diesing 1992) and forcing a postverbal linearization.

Lastly, we showed that *de*, which is obligatory, is a nominal functor (cf. Ihsane 2013) at the Comp-Infl interface whose role is to recategorize a referential DP into a property denoting DP.
