# The group of automorphisms of the Lie algebra of derivations of a polynomial algebra 

V. V. Bavula

#### Abstract

We prove that the group of automorphisms of the Lie algebra $\operatorname{Der}_{K}\left(P_{n}\right)$ of derivations of a polynomial algebra $P_{n}=K\left[x_{1}, \ldots, x_{n}\right]$ over a field of characteristic zero is canonically isomorphic to the the group of automorphisms of the polynomial algebra $P_{n}$.

Key Words: Group of automorphisms, monomorphism, Lie algebra, automorphism, locally nilpotent derivation.

Mathematics subject classification 2010: 17B40, 17B20, 17B66, 17B65, 17B30.

## 1 Introduction

In this paper, module means a left module, $K$ is a field of characteristic zero and $K^{*}$ is its group of units, and the following notation is fixed:

- $P_{n}:=K\left[x_{1}, \ldots, x_{n}\right]=\bigoplus_{\alpha \in \mathbb{N}^{n}} K x^{\alpha}$ is a polynomial algebra over $K$ where $x^{\alpha}:=x_{1}^{\alpha_{1}} \cdots x_{n}^{\alpha_{n}}$,
- $G_{n}:=\operatorname{Aut}_{K}\left(P_{n}\right)$ is the group of automorphisms of the polynomial algebra $P_{n}$,
- $\partial_{1}:=\frac{\partial}{\partial x_{1}}, \ldots, \partial_{n}:=\frac{\partial}{\partial x_{n}}$ are the partial derivatives ( $K$-linear derivations) of $P_{n}$,
- $D_{n}:=\operatorname{Der}_{K}\left(P_{n}\right)=\bigoplus_{i=1}^{n} P_{n} \partial_{i}$ is the Lie algebra of $K$-derivations of $P_{n}$ where $[\partial, \delta]:=$ $\partial \delta-\delta \partial$,
- $\delta_{1}:=\operatorname{ad}\left(\partial_{1}\right), \ldots, \delta_{n}:=\operatorname{ad}\left(\partial_{n}\right)$ are the inner derivations of the Lie algebra $D_{n}$ determined by the elements $\partial_{1}, \ldots, \partial_{n}($ where $\operatorname{ad}(a)(b):=[a, b])$,
- $\mathbb{G}_{n}:=\operatorname{Aut}_{\text {Lie }}\left(D_{n}\right)$ is the group of automorphisms of the Lie algebra $D_{n}$,
- $\mathcal{D}_{n}:=\bigoplus_{i=1}^{n} K \partial_{i}$,
- $\mathcal{H}_{n}:=\bigoplus_{i=1}^{n} K H_{i}$ where $H_{1}:=x_{1} \partial_{1}, \ldots, H_{n}:=x_{n} \partial_{n}$,
- $A_{n}:=K\left\langle x_{1}, \ldots, x_{n}, \partial_{1}, \ldots, \partial_{n}\right\rangle=\bigoplus_{\alpha, \beta \in \mathbb{N}^{n}} K x^{\alpha} \partial^{\beta}$ is the $n^{\prime}$ th Weyl algebra,
- for each natural number $n \geq 2, \mathfrak{u}_{n}:=K \partial_{1}+P_{1} \partial_{2}+\cdots+P_{n-1} \partial_{n}$ is the Lie algebra of triangular polynomial derivations (it is a Lie subalgebra of the Lie algebra $D_{n}$ ) and $\operatorname{Aut}_{K}\left(\mathfrak{u}_{n}\right)$ is its group of automorphisms.

The aim of the paper is to prove the following theorem.
Theorem $1.1 \mathbb{G}_{n}=G_{n}$.
Structure of the proof. (i) $G_{n} \subseteq \mathbb{G}_{n}$ via the group monomorphism (Lemma 2.3.(3))

$$
G_{n} \rightarrow \mathbb{G}_{n}, \quad \sigma \mapsto \sigma: \partial \mapsto \sigma(\partial):=\sigma \partial \sigma^{-1}
$$

(ii) Let $\sigma \in \mathbb{G}_{n}$. Then $\partial_{1}^{\prime}:=\sigma\left(\partial_{1}\right), \ldots, \partial_{n}^{\prime}:=\sigma\left(\partial_{n}\right)$ are commuting, locally nilpotent derivations of the polynomial algebra $P_{n}$ (Lemma 2.6.(1)).
(iii) $\bigcap_{i=1}^{n} \operatorname{ker}_{P_{n}}\left(\partial_{i}^{\prime}\right)=K$ (Lemma [2.6](2)).
(iv)(crux) There exists a polynomial automorphism $\tau \in G_{n}$ such that $\tau \sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)$ (Corollary 2.9).
(v) $\operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)=\operatorname{Sh}_{n}$ (Proposition [2.5)(3)) where

$$
\mathrm{Sh}_{n}:=\left\{s_{\lambda} \in G_{n} \mid s_{\lambda}\left(x_{1}\right)=x_{1}+\lambda_{1}, \ldots, s_{\lambda}\left(x_{n}\right)=x_{n}+\lambda_{n}\right\}
$$

is the shift group of automorphisms of the polynomial algebra $P_{n}$ and $\lambda=\left(\lambda_{1}, \ldots, \lambda_{n}\right) \in K^{n}$.
(vi) By (iv) and (v), $\sigma \in G_{n}$, i.e. $\mathbb{G}_{n}=G_{n}$.

An analogue of the Jacobian Conjecture is true for $D_{n}$. The Jacobian Conjecture claims that certain monomorphisms of the polynomial algebra $P_{n}$ are isomorphisms: Every algebra endomorphism $\sigma$ of the polynomial algebra $P_{n}$ such that $\mathcal{J}(\sigma):=\operatorname{det}\left(\frac{\partial \sigma\left(x_{i}\right)}{\partial x_{j}}\right) \in K^{*}$ is an automorphism. The condition that $\mathcal{J}(\sigma) \in K^{*}$ implies that the endomorphism $\sigma$ is a monomorphism.

Conjecture. Every homomorphism of the Lie algebra $D_{n}$ is an automorphism.
Theorem 1.2 [4] Every monomorphism of the Lie algebra $\mathfrak{u}_{n}$ is an automorphism.
Remark. Not every epimorphism of the Lie algebra $\mathfrak{u}_{n}$ is an automorphism. Moreover, there are countably many distinct ideals $\left\{I_{i \omega^{n-1}} \mid i \geq 0\right\}$ such that

$$
I_{0}=\{0\} \subset I_{\omega^{n-1}} \subset I_{2 \omega^{n-1}} \subset \cdots \subset I_{i \omega^{n-1}} \subset \cdots
$$

and the Lie algebras $\mathfrak{u}_{n} / I_{i \omega^{n-1}}$ and $\mathfrak{u}_{n}$ are isomorphic (Theorem 5.1.(1), [5]).
Theorems 1.2 and Conjecture have bearing of the Jacobian Conjecture and the Conjecture of Dixmier [8 for the Weyl algebra $A_{n}$ over a field of characteristic zero that claims: every homomorphism of the Weyl algebra is an automorphism. The Weyl algebra $A_{n}$ is a simple algebra, so every algebra endomorphism of $A_{n}$ is a monomorphism. This conjecture is open since 1968 for all $n \geq 1$. It is stably equivalent to the Jacobian Conjecture for the polynomial algebras as was shown by Tsuchimoto [9], Belov-Kanel and Kontsevich [7, (see also [2] for a short proof which is based on the author's new inversion formula for polynomial automorphisms [1]).

An analogue of the Conjecture of Dixmier is true for the algebra $\mathbb{I}_{1}:=K\left\langle x, \frac{d}{d x}, \int\right\rangle$ of polynomial integro-differential operators.

Theorem 1.3 (Theorem 1.1, [3) Each algebra endomorphism of $\mathbb{I}_{1}$ is an automorphism.
In contrast to the Weyl algebra $A_{1}=K\left\langle x, \frac{d}{d x}\right\rangle$, the algebra of polynomial differential operators, the algebra $\mathbb{I}_{1}$ is neither a left/right Noetherian algebra nor a simple algebra. The left localizations, $A_{1, \partial}$ and $\mathbb{I}_{1, \partial}$, of the algebras $A_{1}$ and $\mathbb{I}_{1}$ at the powers of the element $\partial=\frac{d}{d x}$ are isomorphic. For the simple algebra $A_{1, \partial} \simeq \mathbb{I}_{1, \partial}$, there are algebra endomorphisms that are not automorphisms [3].

The group of automorphisms of the Lie algebra $\mathfrak{u}_{n}$. In [6], the group of automorphisms $\operatorname{Aut}_{K}\left(\mathfrak{u}_{n}\right)$ of the Lie algebra $\mathfrak{u}_{n}$ of triangular polynomial derivations is found $(n \geq 2)$, it is isomorphic to an iterated semi-direct product (Theorem 5.3, [6]),

$$
\mathbb{T}^{n} \ltimes\left(\operatorname{UAut}_{K}\left(P_{n}\right)_{n} \rtimes\left(\mathbb{F}_{n}^{\prime} \times \mathbb{E}_{n}\right)\right)
$$

where $\mathbb{T}^{n}$ is an algebraic $n$-dimensional torus, $\operatorname{UAut}_{K}\left(P_{n}\right)_{n}$ is an explicit factor group of the group $\operatorname{UAut}_{K}\left(P_{n}\right)$ of unitriangular polynomial automorphisms, $\mathbb{F}_{n}^{\prime}$ and $\mathbb{E}_{n}$ are explicit groups that are isomorphic respectively to the groups $\mathbb{I}$ and $\mathbb{J}^{n-2}$ where $\mathbb{I}:=\left(1+t^{2} K[[t]], \cdot\right) \simeq K^{\mathbb{N}}$
and $\mathbb{J}:=(t K[[t]],+) \simeq K^{\mathbb{N}}$. Comparing the groups $G_{n}$ and $\operatorname{Aut}_{K}\left(\mathfrak{u}_{n}\right)$ we see that the group (UAut ${ }_{K}\left(P_{n}\right)_{n}$ of polynomial automorphisms is a tiny part of the group Aut ${ }_{K}\left(\mathfrak{u}_{n}\right)$ but in contrast $\mathbb{G}_{n}=\operatorname{Aut}_{K}\left(P_{n}\right)$. It is shown that the adjoint group of automorphisms $\mathcal{A}\left(\mathfrak{u}_{n}\right)$ of the Lie algebra $\mathfrak{u}_{n}$ is equal to the group $\operatorname{UAut}_{K}\left(P_{n}\right)_{n}$ (Theorem 7.1, [6]). Recall that the adjoint group $\mathcal{A}(\mathcal{G})$ of a Lie algebra $\mathcal{G}$ is generated by the elements $e^{\operatorname{ad}(g)}:=\sum_{i \geq 0} \frac{\operatorname{ad}(g)^{i}}{i!} \in \operatorname{Aut}_{K}(\mathcal{G})$ where $g$ runs through all the locally nilpotent elements of the Lie algebra $\mathcal{G}$ (an element $g$ is a locally nilpotent element if the inner derivation $\operatorname{ad}(g):=[g, \cdot]$ of the Lie algebra $\mathcal{G}$ is a locally nilpotent derivation).

## 2 Proof of Theorem 1.1

This section can be seen as a proof of Theorem 1.1. The proof is split into several statements that reflect 'Structure of the proof of Theorem 1.1] given in the Introduction.

The Lie algebra $D_{n}$ is $\mathbb{Z}^{n}$-graded. The Lie algebra

$$
\begin{equation*}
D_{n}=\bigoplus_{\alpha \in \mathbb{N}^{n}} \bigoplus_{i=1}^{n} K x^{\alpha} \partial_{i} \tag{1}
\end{equation*}
$$

is a $\mathbb{Z}^{n}$-graded Lie algebra

$$
D_{n}=\bigoplus_{\beta \in \mathbb{Z}^{n}} D_{n, \beta} \text { where } D_{n, \beta}=\bigoplus_{\alpha-e_{i}=\beta} K x^{\alpha} \partial_{i}
$$

i.e. $\left[D_{n, \alpha}, D_{n, \beta}\right] \subseteq D_{n, \alpha+\beta}$ for all $\alpha, \beta \in \mathbb{N}^{n}$ where $e_{1}:=(1,0, \ldots, 0), \ldots, e_{n}:=(0, \ldots, 0,1)$ is the canonical free basis for the free abelian group $\mathbb{Z}^{n}$. This follows from the commutation relations

$$
\begin{equation*}
\left[x^{\alpha} \partial_{i}, x^{\beta} \partial_{j}\right]=\beta_{i} x^{\alpha+\beta-e_{i}} \partial_{j}-\alpha_{j} x^{\alpha+\beta-e_{j}} \partial_{i} \tag{2}
\end{equation*}
$$

Clearly, for all $i, j=1, \ldots, n$ and $\alpha \in \mathbb{N}^{n}$,

$$
\begin{gather*}
{\left[H_{j}, x^{\alpha} \partial_{i}\right]= \begin{cases}\alpha_{j} x^{\alpha} \partial_{i} & \text { if } j \neq i, \\
\left(\alpha_{i}-1\right) x^{\alpha} \partial_{i} & \text { if } j=i,\end{cases} }  \tag{3}\\
{\left[\partial_{j}, x^{\alpha} \partial_{i}\right]=\alpha_{j} x^{\alpha-e_{j}} \partial_{i}} \tag{4}
\end{gather*}
$$

The support $\operatorname{Supp}\left(D_{n}\right):=\left\{\beta \in \mathbb{Z}^{n} \mid D_{n, \beta} \neq 0\right\}$ is a submonoid of $\mathbb{Z}^{n}$. Let us find the support $\operatorname{Supp}\left(D_{n}\right)$, the graded components $D_{n, \beta}$ and their dimensions $\operatorname{dim}_{K} D_{n, \beta}$. For each $i=1, \ldots, n$, let $\mathbb{N}^{n, i}:=\left\{\alpha \in \mathbb{N}^{n} \mid \alpha_{i}=0\right\}$ and $P_{n}^{\partial_{i}}:=\operatorname{ker}_{P_{n}}\left(\partial_{i}\right)$. It follows from the decompositions $P_{n}=$ $P_{n}^{\partial_{i}} \oplus P_{n} x_{i}$ for $i=1, \ldots, n$ that

$$
\begin{gather*}
D_{n}=\bigoplus_{i=1}^{n}\left(P_{n}^{\partial_{i}} \oplus P_{n} x_{i}\right) \partial_{i}=\bigoplus_{i=1}^{n} P_{n}^{\partial_{i}} \partial_{i} \oplus \bigoplus_{i=1}^{n} P_{n} H_{i} \\
D_{n}=\bigoplus_{i=1}^{n} P_{n}^{\partial_{i}} \partial_{i} \oplus \bigoplus_{\alpha \in \mathbb{N}^{n}} x^{\alpha} \mathcal{H}_{n} \tag{5}
\end{gather*}
$$

Hence,

$$
\begin{gather*}
\operatorname{Supp}\left(D_{n}\right)=\coprod_{i=1}^{n}\left(\mathbb{N}^{n, i}-e_{i}\right) \coprod \mathbb{N}^{n} .  \tag{6}\\
D_{n, \beta}= \begin{cases}x^{\alpha} \partial_{i} & \text { if } \beta=\alpha-e_{i} \in \mathbb{N}^{n, i}-e_{i} \\
x^{\beta} \mathcal{H}_{n} & \text { if } \beta \in \mathbb{N}^{n} .\end{cases}  \tag{7}\\
\operatorname{dim}_{K} D_{n, \beta}= \begin{cases}1 & \text { if } \beta=\alpha-e_{i} \in \mathbb{N}^{n, i}-e_{i} \\
n & \text { if } \beta \in \mathbb{N}^{n}\end{cases}
\end{gather*}
$$

Let $\mathcal{G}$ be a Lie algebra and $\mathcal{H}$ be its Lie subalgebra. The centralizer $C_{\mathcal{G}}(\mathcal{H}):=\{x \in \mathcal{G} \mid[x, \mathcal{H}]=$ $0\}$ of $\mathcal{H}$ in $\mathcal{G}$ is a Lie subalgebra of $\mathcal{G}$. In particular, $Z(\mathcal{G}):=C_{\mathcal{G}}(\mathcal{G})$ is the centre of the Lie algebra $\mathcal{G}$. The normalizer $N_{\mathcal{G}}(\mathcal{H}):=\{x \in \mathcal{G} \mid[x, \mathcal{H}] \subseteq \mathcal{H}\}$ of $\mathcal{H}$ in $\mathcal{G}$ is a Lie subalgebra of $\mathcal{G}$, it is the largest Lie subalgebra of $\mathcal{G}$ that contains $\mathcal{H}$ as an ideal.

Let $V$ be a vector space over $K$. A $K$-linear map $\delta: V \rightarrow V$ is called a locally nilpotent map if $V=\bigcup_{i \geq 1} \operatorname{ker}\left(\delta^{i}\right)$ or, equivalently, for every $v \in V, \delta^{i}(v)=0$ for all $i \gg 1$. When $\delta$ is a locally nilpotent map in $V$ we also say that $\delta$ acts locally nilpotently on $V$. Every nilpotent linear map $\delta$, that is $\delta^{n}=0$ for some $n \geq 1$, is a locally nilpotent map but not vice versa, in general. Let $\mathcal{G}$ be a Lie algebra. Each element $a \in \mathcal{G}$ determines the derivation of the Lie algebra $\mathcal{G}$ by the rule $\operatorname{ad}(a): \mathcal{G} \rightarrow \mathcal{G}, b \mapsto[a, b]$, which is called the inner derivation associated with $a$. The $\operatorname{set} \operatorname{Inn}(\mathcal{G})$ of all the inner derivations of the Lie algebra $\mathcal{G}$ is a Lie subalgebra of the Lie algebra $\left(\operatorname{End}_{K}(\mathcal{G}),[\cdot, \cdot]\right)$ where $[f, g]:=f g-g f$. There is the short exact sequence of Lie algebras

$$
0 \rightarrow Z(\mathcal{G}) \rightarrow \mathcal{G} \xrightarrow{\text { ad }} \operatorname{Inn}(\mathcal{G}) \rightarrow 0
$$

that is $\operatorname{Inn}(\mathcal{G}) \simeq \mathcal{G} / Z(\mathcal{G})$ where $Z(\mathcal{G})$ is the centre of the Lie algebra $\mathcal{G}$ and $\operatorname{ad}([a, b])=[\operatorname{ad}(a), \operatorname{ad}(b)]$ for all elements $a, b \in \mathcal{G}$. An element $a \in \mathcal{G}$ is called a locally nilpotent element (respectively, a nilpotent element) if so is the inner derivation $\operatorname{ad}(a)$ of the Lie algebra $\mathcal{G}$.

The Cartan subalgebra $\mathcal{H}_{n}$ of $D_{n}$. A nilpotent Lie subalgebra $C$ of a Lie algebra $\mathcal{G}$ is called a Cartan subalgebra of $\mathcal{G}$ if it coincides with its normalizer. We use often the following obvious observation: An abelian Lie subalgebra that coincides with its centralizer is a maximal abelian Lie subalgebra.

Lemma 2.1 1. $\mathcal{H}_{n}$ is a Cartan subalgebra of $D_{n}$.
2. $\mathcal{H}_{n}=C_{D_{n}}\left(\mathcal{H}_{n}\right)$ is a maximal abelian subalgebra of $D_{n}$.

Proof. Statements 1 and 2 follows from (6) and (7).
$P_{n}$ is a $D_{n}$-module. The polynomial algebra $P_{n}$ is a (left) $D_{n}$-module: $D_{n} \times P_{n} \rightarrow P_{n}$, $(\partial, p) \mapsto \partial * p$. In more detail, if $\partial=\sum_{i=1}^{n} a_{i} \partial_{i}$ where $a_{i} \in P_{n}$ then

$$
\partial * p=\sum_{i=1}^{n} a_{i} \frac{\partial p}{\partial x_{i}}
$$

The field $K$ is a $D_{n}$-submodule of $P_{n}$ and

$$
\begin{equation*}
\bigcap_{i=1}^{n} \operatorname{ker}_{P_{n}}\left(\partial_{i}\right)=K . \tag{8}
\end{equation*}
$$

Lemma 2.2 The $D_{n}$-module $P_{n} / K$ is simple with $\operatorname{End}_{D_{n}}\left(P_{n} / K\right)=K$ id where id is the identity map.

Proof. Let $M$ be a nonzero submodule of $P_{n} / K$ and $0 \neq p \in M$. Using the actions of $\partial_{1}, \ldots, \partial_{n}$ on $p$ we obtain an element of $M$ of the form $\lambda x_{i}$ for some $\lambda \in K^{*}$. Hence, $x_{i} \in M$ and $x^{\alpha}=x^{\alpha} \partial_{i} * x_{i} \in M$ for all $0 \neq \alpha \in \mathbb{N}^{n}$. Therefore, $M=P_{n} / K$. Let $f \in \operatorname{End}_{D_{n}}\left(P_{n} / K\right)$. Then applying $f$ to the equalities $\partial_{i} *\left(x_{1}+K\right)=\delta_{i 1}$ for $i=1, \ldots, n$, we obtain the equalities

$$
\partial_{i} * f\left(x_{1}+K\right)=\delta_{i 1} \text { for } i=1, \ldots, n
$$

Hence, $f\left(x_{1}+K\right) \in \bigcap_{i=2}^{n} \operatorname{ker}_{P_{n} / K}\left(\partial_{i}\right) \cap \operatorname{ker}_{P_{n} / K}\left(\partial_{i}^{2}\right)=\left(K\left[x_{1}\right] / K\right) \cap \operatorname{ker}_{P_{n} / K}\left(\partial_{i}^{2}\right)=K\left(x_{1}+K\right)$. So, $f\left(x_{1}+K\right)=\lambda\left(x_{1}+K\right)$ and so $f=\lambda$ id, by the simplicity of the $D_{n}$-module $P_{n} / K$.

The $G_{n}$-module $D_{n}$. The Lie algebra $D_{n}$ is a $G_{n}$-module,

$$
G_{n} \times D_{n} \rightarrow D_{n}, \quad(\sigma, \partial) \mapsto \sigma(\partial):=\sigma \partial \sigma^{-1}
$$

Every automorphism $\sigma \in G_{n}$ is uniquely determined by the elements

$$
x_{1}^{\prime}:=\sigma\left(x_{1}\right), \ldots, x_{n}^{\prime}:=\sigma\left(x_{n}\right)
$$

Let $M_{n}\left(P_{n}\right)$ be the algebra of $n \times n$ matrices over $P_{n}$. The matrix $J(\sigma):=\left(J(\sigma)_{i j}\right) \in M_{n}\left(P_{n}\right)$, where $J(\sigma)_{i j}=\frac{\partial x_{j}^{\prime}}{\partial x_{i}}$, is called the Jacobian matrix of the automorphism (endomorphism) $\sigma$ and its determinant $\mathcal{J}(\sigma):=\operatorname{det} J(\sigma)$ is called the Jacobian of $\sigma$. So, the $j$ 'th column of $J(\sigma)$ is the gradient $\operatorname{grad} x_{j}^{\prime}:=\left(\frac{\partial x_{j}^{\prime}}{\partial x_{1}}, \ldots, \frac{\partial x_{j}^{\prime}}{\partial x_{n}}\right)^{T}$ of the polynomial $x_{j}^{\prime}$. Then the derivations

$$
\partial_{1}^{\prime}:=\sigma \partial_{1} \sigma^{-1}, \ldots, \partial_{n}^{\prime}:=\sigma \partial_{n} \sigma^{-1}
$$

are the partial derivatives of $P_{n}$ with respect to the variables $x_{1}^{\prime}, \ldots, x_{n}^{\prime}$,

$$
\begin{equation*}
\partial_{1}^{\prime}=\frac{\partial}{\partial x_{1}^{\prime}}, \ldots, \partial_{n}^{\prime}=\frac{\partial}{\partial x_{n}^{\prime}} \tag{9}
\end{equation*}
$$

Every derivation $\partial \in D_{n}$ is a unique sum $\partial=\sum_{i=1}^{n} a_{i} \partial_{i}$ where $a_{i}=\partial * x_{i} \in P_{n}$. Let $\partial:=$ $\left(\partial_{1}, \ldots, \partial_{n}\right)^{T}$ and $\partial^{\prime}:=\left(\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}\right)^{T}$ where $T$ stands for the transposition. Then

$$
\begin{equation*}
\partial^{\prime}=J(\sigma)^{-1} \partial, \text { i.e. } \partial_{i}^{\prime}=\sum_{j=1}^{n}\left(J(\sigma)^{-1}\right)_{i j} \partial_{j} \text { for } i=1, \ldots, n \tag{10}
\end{equation*}
$$

In more detail, if $\partial^{\prime}=A \partial$ where $A=\left(a_{i j}\right) \in M_{n}\left(P_{n}\right)$, i.e. $\partial_{i}=\sum_{j=1}^{n} a_{i j} \partial_{j}$. Then for all $i, j=1, \ldots, n$,

$$
\delta_{i j}=\partial_{i}^{\prime} * x_{j}^{\prime}=\sum_{k=1}^{n} a_{i k} \frac{\partial x_{j}^{\prime}}{\partial x_{k}}
$$

where $\delta_{i j}$ is the Kronecker delta function. The equalities above can be written in the matrix form as $A J(\sigma)=1$ where 1 is the identity matrix. Therefore, $A=J(\sigma)^{-1}$.

Suppose that a group $G$ acts on a set $S$. For a nonempty subset $T$ of $S, \operatorname{St}_{G}(T):=\{g \in$ $G \mid g T=T\}$ is the stabilizer of the set $T$ in $G$ and $\operatorname{Fix}_{G}(T):=\{g \in G \mid g t=t$ for all $t \in T\}$ is the fixator of the set $T$ in $G$. Clearly, $\operatorname{Fix}_{G}(T)$ is a normal subgroup of $\operatorname{St}_{G}(T)$.

## The maximal abelian Lie subalgebra $\mathcal{D}_{n}$ of $D_{n}$.

Lemma 2.3 1. $C_{D_{n}}\left(\mathcal{D}_{n}\right)=\mathcal{D}_{n}$ and so $\mathcal{D}_{n}$ is a maximal abelian Lie subalgebra of $D_{n}$.
2. $\operatorname{Fix}_{G_{n}}\left(\mathcal{D}_{n}\right)=\operatorname{Fix}_{G_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)=\operatorname{Sh}_{n}$.
3. $D_{n}$ is a faithful $G_{n}$-module, i.e. the group homomorphism $G_{n} \rightarrow \mathbb{G}_{n}, \sigma \mapsto \sigma: \partial \mapsto \sigma \partial \sigma^{-1}$, is a monomorphism.
4. $\operatorname{Fix}_{G_{n}}\left(\partial_{1}, \ldots, \partial_{n}, H_{1}, \ldots, H_{n}\right)=\{e\}$.

Proof. 1. Statement 1 follows from (2).
2. Let $\sigma \in \operatorname{Fix}_{G_{n}}\left(D_{n}\right)$ and $J(\sigma)=\left(J_{i j}\right)$. By (10), $\partial=J(\sigma) \partial$, and so, for all $i, j=1, \ldots, n$, $\delta_{i j}=\partial_{i} * x_{j}=J_{i j}$, i.e. $J(\sigma)=1$, or equivalently, by (8),

$$
x_{1}^{\prime}=x_{1}+\lambda_{1}, \ldots, x_{n}^{\prime}=x_{n}+\lambda_{n}
$$

for some scalars $\lambda_{i} \in K$, and so $\sigma \in \mathrm{Sh}_{n}$.
3 and 4. Let $\sigma \in \operatorname{Fix}_{G_{n}}=\left(\partial_{1}, \ldots, \partial_{n}, H_{1}, \ldots, H_{n}\right)$. Then $\sigma \in \operatorname{Fix}_{G_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)=\operatorname{Sh}_{n}$, by statement 2. So, $\sigma\left(x_{1}\right)=x_{1}+\lambda_{1}, \ldots, \sigma\left(x_{n}\right)=x_{n}+\lambda_{n}$ where $\lambda_{i} \in K$. Then $x_{i} \partial_{i}=\sigma\left(x_{i} \partial_{i}\right)=$ $\left(x_{i}+\lambda_{i}\right) \partial_{i}$ for $i=1, \ldots, n$, and so $\lambda_{1}=\cdots=\lambda_{n}=0$. This means that $\sigma=e$. So, $\operatorname{Fix}_{G_{n}}=$ $\left(\partial_{1}, \ldots, \partial_{n}, H_{1}, \ldots, H_{n}\right)=\{e\}$ and $D_{n}$ is a faithful $G_{n}$-module.

By Lemma 2.3.(3), we identify the group $G_{n}$ with its image in $\mathbb{G}_{n}$.

Lemma 2.4 1. $D_{n}$ is a simple Lie algebra.
2. $Z\left(D_{n}\right)=\{0\}$.
3. $\left[D_{n}, D_{n}\right]=D_{n}$.

Proof. 1. Let $0 \neq a \in D_{n}$ and $\mathfrak{a}=(a)$ be the ideal of the Lie algebra $D_{n}$ generated by the element $a$. We have to show that $\mathfrak{a}=D_{n}$. Using the inner derivations $\delta_{1}, \ldots, \delta_{n}$ we see that $\partial_{i} \in \mathfrak{a}$ for some $i$. Then $\mathfrak{a}=D_{n}$ since

$$
x^{\alpha} \partial_{j}=\left(\alpha_{i}+1\right)^{-1}\left[\partial_{i}, x^{\alpha+e_{i}} \partial_{j}\right] \in \mathfrak{a}
$$

for all $\alpha$ and $j$.
2 and 3 . Statements 2 and 3 follow from statement 1.

Proposition 2.5 1. $\operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}, H_{1}, \ldots, H_{n}\right)=\{e\}$.
2. Let $\sigma, \tau \in \mathbb{G}_{n}$. Then $\sigma=\tau$ iff $\sigma\left(\partial_{i}\right)=\tau\left(\partial_{i}\right)$ and $\sigma\left(H_{i}\right)=\tau\left(H_{i}\right)$ for $i=1, \ldots, n$.
3. $\operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)=\operatorname{Sh}_{n}$.

Proof. 1. Let $\sigma \in F:=\operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}, H_{1}, \ldots, H_{n}\right)$. We have to show that $\sigma=e$. Since $\sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(H_{1}, \ldots, H_{n}\right)$, the automorphism $\sigma$ respects the weight decomposition of $D_{n}$. By (7), $\sigma\left(x^{\alpha} \partial_{i}\right)=\lambda_{\alpha, i} x^{\alpha} \partial_{i}$ for all $\alpha \in \mathbb{N}^{n, i}$ and $i=1, \ldots, n$ where $\lambda_{\alpha, i} \in K$. Clearly, $\lambda_{0, i}=1$ for $i=1, \ldots, n$. Since $\sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)$, by applying $\sigma$ to the relations $\alpha_{j} x^{\alpha-e_{j}} \partial_{i}=\left[\partial_{j}, x^{\alpha} \partial_{i}\right]$, we get the relations

$$
\alpha_{j} \lambda_{\alpha-e_{j}, i} x^{\alpha-e_{j}} \partial_{i}=\left[\partial_{j}, \lambda_{\alpha, i} x^{\alpha} \partial_{i}\right]=\alpha_{j} \lambda_{\alpha, i} x^{\alpha-e_{j}} \partial_{i}
$$

Hence $\lambda_{\alpha, i}=\lambda_{\alpha-e_{j}, i}$ provided $\alpha_{j} \neq 0$. We conclude that all the coefficients $\lambda_{\alpha, i}$ are equal to one of the coefficients $\lambda_{e_{i}, j}$ where $i, j=1, \ldots, n$ and $i \neq j$. The relations $\partial_{j}=\left[\partial_{i}, x_{i} \partial_{j}\right]$ implies the relations $\partial_{j}=\left[\partial_{i}, \lambda_{e_{i}, j} x_{i} \partial_{j}\right]=\lambda_{e_{i}, j} \partial_{j}$, hence all the coefficients $\lambda_{e_{i}, j}$ are equal to 1 . So, $\oplus_{i=1}^{n} P_{n}^{\partial_{i}} \partial_{i} \subseteq \mathcal{F}:=\operatorname{Fix}_{D_{n}}(\sigma):=\left\{\partial \in D_{n} \mid \sigma(\partial)=\partial\right\}$. To finish the proof of statement 1 it suffices to show that $x^{\alpha} H_{i} \in \mathcal{F}$ for all $\alpha \in \mathbb{N}^{n}$ and $i=1, \ldots, n$, see (5) and (6). We use induction on $|\alpha|:=\alpha_{1}+\cdots+\alpha_{n}$. If $|\alpha|=0$ the statement is obvious as $\sigma \in F$. Suppose that $|\alpha|>0$. Using the commutation relations

$$
\left[\partial_{j}, x^{\alpha} H_{i}\right]= \begin{cases}\alpha_{j} x^{\alpha-e_{j}} H_{i} & \text { if } j \neq i  \tag{11}\\ \left(\alpha_{i}+1\right) x^{\alpha} \partial_{i} & \text { if } j=i\end{cases}
$$

the induction and the previous case, we see that

$$
\left[\partial_{j}, \sigma\left(x^{\alpha} H_{i}\right)-x^{\alpha} H_{i}\right]=0 \text { for } i=1, \ldots, n .
$$

Therefore, $\sigma\left(x^{\alpha} H_{i}\right)-x^{\alpha} H_{i} \in C_{D_{n}}\left(\mathcal{D}_{n}\right)=\mathcal{D}_{n}$. Since the automorphism $\sigma$ respects the weight decomposition of $D_{n}$, we must have $\sigma\left(x^{\alpha} H_{i}\right)-x^{\alpha} H_{i} \in x^{\alpha} \mathcal{H}_{n} \cap \mathcal{D}_{n}=\{0\}$. Hence, $x^{\alpha} H_{i} \in \mathcal{F}$, as required.
2. Statement 2 follows from statement 1.
3. Clearly, $\mathrm{Sh}_{n} \subseteq F=\operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)$. Let $\sigma \in F$ and $H_{i}^{\prime}:=\sigma\left(H_{i}\right), \ldots, H_{n}^{\prime}:=\sigma\left(H_{n}\right)$. Applying the automorphism $\sigma$ to the commutation relations $\left[\partial_{i}, H_{j}\right]=\delta_{i j} \partial_{i}$ gives the relations $\left[\partial_{i}, H_{j}^{\prime}\right]=\delta_{i j} \partial_{i}$. By taking the difference, we see that $\left[\partial_{i}, H_{j}^{\prime}-H_{j}\right]=0$ for all $i$ and $j$. Therefore, $H_{i}^{\prime}=H_{i}+d_{i}$ for some elements $d_{i} \in C_{D_{n}}\left(\mathcal{D}_{n}\right)=\mathcal{D}_{n}$ (Lemma 2.3), (1)), and so $d_{i}=\sum_{j=1}^{n} \lambda_{i j} \partial_{j}$ for some elements $\lambda_{i j} \in K$. The elements $H_{1}^{\prime}, \ldots, H_{n}^{\prime}$ commute, hence

$$
\left[H_{j}, \partial_{i}\right]=\left[H_{i}, \partial_{j}\right] \text { for all } i, j
$$

or equivalently,

$$
\lambda_{i j} \partial_{j}=\lambda_{j i} \partial_{i} \text { for all } i, j
$$

This means that $\lambda_{i j}=0$ for all $i \neq j$, i.e.

$$
H_{i}^{\prime}=H_{i}+\lambda_{i i} \partial_{i}=\left(x_{i}+\lambda_{i i}\right) \partial_{i}=s_{\lambda}\left(H_{i}\right)
$$

where $s_{\lambda} \in \operatorname{Sh}_{n}, s_{\lambda}\left(x_{i}\right)=x_{i}+\lambda_{i i}$ for all $i$. Then $s_{\lambda}^{-1} \sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}, H_{1}, \ldots, H_{n}\right)=\{e\}$ (statement 2), and so $\sigma=s_{\lambda} \in \mathrm{Sh}_{n}$.

Lemma 2.6 Let $\sigma \in \mathbb{G}_{n}$ and $\partial_{1}^{\prime}:=\sigma\left(\partial_{1}\right), \ldots, \partial_{n}^{\prime}:=\sigma\left(\partial_{n}\right)$. Then

1. $\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}$ are commuting, locally nilpotent derivations of $P_{n}$.
2. $\bigcap_{i=1}^{n} \operatorname{ker}_{D_{n}}\left(\partial_{i}^{\prime}\right)=K$.

Proof. 1. The derivations $\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}$ commute since $\partial_{1}, \ldots, \partial_{n}$ are commute. The inner derivations $\delta_{1}, \ldots, \delta_{n}$ of the Lie algebra $D_{n}$ are commuting and locally nilpotent. Hence, inner derivations

$$
\delta_{1}^{\prime}:=\operatorname{ad}\left(\partial_{1}^{\prime}\right), \ldots, \delta_{n}^{\prime}:=\operatorname{ad}\left(\partial_{n}^{\prime}\right)
$$

of the Lie algebra $D_{n}$ are commuting and locally nilpotent. The vector space $P_{n} \partial_{i}^{\prime}$ is closed under the derivations $\delta_{j}^{\prime}$ since

$$
\delta_{j}^{\prime}\left(P_{n} \partial_{i}^{\prime}\right)=\left[\partial_{j}^{\prime}, P_{n} \partial_{i}^{\prime}\right]=\left(\partial_{j}^{\prime} * P_{n}\right) \cdot \partial_{i}^{\prime} \subseteq P_{n} \partial_{i}^{\prime} .
$$

Therefore, $\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}$ are locally nilpotent derivations of the polynomial algebra $P_{n}$.
2. Let $\lambda \in \bigcap_{i=1}^{n} \operatorname{ker}_{P_{n}}\left(\partial_{i}^{\prime}\right)$. Then

$$
\lambda \partial_{1}^{\prime} \in C_{D_{n}}\left(\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}\right)=\sigma\left(C_{D_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)\right)=\sigma\left(C_{D_{n}}\left(\mathcal{D}_{n}\right)\right)=\sigma\left(\mathcal{D}_{n}\right)=\sigma\left(\bigoplus_{i=1}^{n} K \partial_{i}\right)=\bigoplus_{i=1}^{n} K \partial_{i}^{\prime}
$$

since $C_{D_{n}}\left(\mathcal{D}_{n}\right)=\mathcal{D}_{n}$, Lemma 2.3.(1). Then $\lambda \in K$ since otherwise the infinite dimensional space $\bigoplus_{i \geq 0} K \lambda^{i} \partial_{1}^{\prime}$ would be a subspace of a finite dimensional space $\sigma\left(\mathcal{D}_{n}\right)$.

The following lemma is well-known and it is easy to prove.
Lemma 2.7 Let $\partial$ be a locally nilpotent derivation of a commutative $K$-algebra $A$ such that $\partial(x)=$ 1 for some element $x \in A$. Then $A=A^{\partial}[x]$ is a polynomial algebra over the ring $A^{\partial}:=\operatorname{ker}(\partial)$ of constants of the derivation $\partial$ in the variable $x$.

The next theorem is the most important point in the proof of Theorem 1.1 and, roughly speaking, the main reason why Theorem 1.1 holds.

Theorem 2.8 Let $\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}$ be commuting, locally nilpotent derivations of the polynomial algebra $P_{n}$ such that $\bigcap_{i=1}^{n} \operatorname{ker}_{P_{n}}\left(\partial_{i}^{\prime}\right)=K$. Then there exist polynomials $x_{1}^{\prime}, \ldots, x_{n}^{\prime} \in P_{n}$ such that

$$
\begin{equation*}
\partial_{i}^{\prime} * x_{j}^{\prime}=\delta_{i j} \tag{12}
\end{equation*}
$$

Moreover, the algebra homomorphism

$$
\sigma: P_{n} \rightarrow P_{n}, \quad x_{1} \mapsto x_{1}^{\prime}, \ldots, x_{n} \mapsto x_{n}^{\prime}
$$

is an automorphism such that $\partial_{i}^{\prime}=\sigma \partial_{i} \sigma^{-1}=\frac{\partial}{\partial x_{i}^{\prime}}$ for $i=1, \ldots, n$.

Proof. Case $n=1$ : By Lemma 2.6, the derivation $\partial_{1}^{\prime}$ of the polynomial algebra $P_{1}$ is a locally nilpotent derivation with $K_{1}^{\prime}:=\operatorname{ker}_{P_{1}}\left(\partial_{1}^{\prime}\right)=K$. Hence, $\partial_{1}^{\prime} * x_{1}^{\prime}=1$ for some polynomial $x_{1}^{\prime} \in P_{1}$. By Lemma 2.7, $K\left[x_{1}\right]=K_{1}^{\prime}\left[x_{1}^{\prime}\right]=K\left[x_{1}^{\prime}\right]$, and so $\sigma: K\left[x_{1}\right] \rightarrow K\left[x_{1}\right], x \mapsto x_{1}^{\prime}$, is an automorphism such that $\partial_{1}^{\prime}=\frac{d}{d x_{1}^{\prime}}=\sigma \frac{d}{d x_{1}} \sigma^{-1}$.

Case $n \geq 2$. Let $K_{i}^{\prime}:=\operatorname{ker}_{P_{n}}\left(\partial_{i}^{\prime}\right)$ for $i=1, \ldots, n$. Clearly, $K \subseteq K_{i}^{\prime}$.
(i) $K_{i}^{\prime} \neq K$ for $i=1, \ldots, n$ : If $K_{i}^{\prime}=K$ for some $i$ then by the same argument as in the case $n=1$ there exists a polynomial $x_{i}^{\prime} \in P_{n}$ such that $\partial_{i}^{\prime} * x_{i}^{\prime}=1$, and so $P_{n}=K_{i}^{\prime}\left[x_{i}^{\prime}\right]=K\left[x_{i}\right]$, a contradiction.
(ii) Let $m$ be the maximum of $\operatorname{card}(I)$ such $\emptyset \neq I \subseteq\{1, \ldots, n-1\}$ and $\bigcap_{i \in I} K_{i}^{\prime} \neq K$. By (i), $2 \leq m \leq n-1$. Changing (if necessary) the order of the derivations $\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}$ we may assume that $A:=\bigcap_{i=1}^{m} K_{i}^{\prime} \neq K$. Then the algebra $A$ is infinite dimensional (since $K \neq A \subseteq P_{n}$ ) and invariant under the action of the derivations $\partial_{j}^{\prime}$ for $j=m+1, \ldots, n$. By the choice of $m$,

$$
A^{\partial_{j}^{\prime}}=K_{j}^{\prime} \cap \bigcap_{i=1}^{m} K_{i}^{\prime}=K \text { for } j=m+1, \ldots, n
$$

and the derivations $\partial_{j}^{\prime}$ acts locally nilpotently on the algebra $A^{\partial_{j}^{\prime}}$. Therefore, for each index $j=m+1, \ldots, n$, there exists an element $x_{j}^{\prime} \in A$ such that $\partial_{j}^{\prime} * x_{j}^{\prime}=1$, and so (Lemma 2.7)

$$
\begin{equation*}
A=A^{\partial_{j}^{\prime}}\left[x_{j}^{\prime}\right]=K\left[x_{j}^{\prime}\right] \text { for } j=m+1, \ldots, n . \tag{13}
\end{equation*}
$$

(ii)(a) Suppose that $m=n-1$, i.e. $\partial_{i}^{\prime} * x_{n}^{\prime}=\delta_{i n}$ for all $i=1, \ldots, n$. By Lemma 2.7, $P_{n}=K_{n}^{\prime}\left[x_{n}^{\prime}\right]$. The algebra $K_{n}^{\prime}$ admits the set of commuting, locally nilpotent derivations

$$
\partial_{1}^{\prime \prime}:=\left.\partial_{1}^{\prime}\right|_{K_{n}^{\prime}}, \ldots, \partial_{n-1}^{\prime \prime}:=\left.\partial_{n-1}^{\prime}\right|_{K_{n}^{\prime}}
$$

with $\bigcap_{i=1}^{n-1} \operatorname{ker}_{K_{n}^{\prime}}\left(\partial_{i}^{\prime \prime}\right)=K_{n}^{\prime} \cap \bigcap_{i=1}^{n-1} K_{i}^{\prime}=K$.
(ii)(b) Suppose that $m<n-1$. By (13),

$$
K^{*} x_{m+1}^{\prime}+K=K^{*} x_{m+2}^{\prime}+K=\cdots=K^{*} x_{n}^{\prime}+K
$$

and so $\lambda_{j}:=\partial_{j}^{\prime} * x_{n}^{\prime} \in K$ for $j=m+1, \ldots, n-1$. Hence, $\left(\partial_{j}^{\prime}-\lambda_{j} \partial_{n}^{\prime}\right) * x_{n}^{\prime}=0$ for $j=$ $m+1, \ldots, n-1$. A linear combination of commuting, locally nilpotent derivations is a locally nilpotent derivation (the proof boils down to the case $\partial+\delta$ of two commuting, locally nilpotent derivations, then the result follows from $(\partial+\delta)^{m}=\sum_{i=0}^{m}\binom{m}{i} \partial^{i} \delta^{m-i}$ and $\left.\partial^{i} \delta^{m-i}=\delta^{m-i} \partial^{i}\right)$. Using the set of commuting, locally nilpotent derivations $\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}$ that satisfy (12) we obtain the set of commuting, locally nilpotent derivations

$$
\delta_{1}^{\prime}:=\partial_{1}^{\prime}, \ldots, \delta_{m}^{\prime}:=\partial_{m}^{\prime}, \delta_{m+1}^{\prime}:=\partial_{m+1}^{\prime}-\lambda_{m+1} \partial_{n}^{\prime}, \ldots, \delta_{n-1}^{\prime}:=\partial_{n-1}^{\prime}-\lambda_{n-1} \partial_{n}^{\prime}, \delta_{n}^{\prime}:=\partial_{n}
$$

that satisfy (12) with

$$
\delta_{i}^{\prime} * x_{n}^{\prime}=\delta_{i n} \text { for } i=1, \ldots, n
$$

Then repeating the arguments of (ii)(a), we see that $P_{n}=K_{n}^{\prime}\left[x_{n}^{\prime}\right]$. The algebra $K_{n}^{\prime}$ admits the set of commuting, locally nilpotent derivations

$$
\partial_{1}^{\prime \prime}:=\left.\delta_{1}^{\prime}\right|_{K_{n}^{\prime}}, \ldots, \partial_{n-1}^{\prime \prime}:=\left.\delta_{n-1}^{\prime}\right|_{K_{n}^{\prime}}
$$

with

$$
\bigcap_{i=1}^{n-1} \operatorname{ker}_{K_{n}^{\prime}}\left(\partial_{i}^{\prime \prime}\right)=K_{n}^{\prime} \cap \bigcap_{i=1}^{n-1} \operatorname{ker}_{P_{n}}\left(\delta_{i}^{\prime}\right)=K_{n}^{\prime} \cap \bigcap_{i=1}^{n-1} \operatorname{ker}_{P_{n}}\left(\partial_{i}^{\prime}\right)=\bigcap_{i=1}^{n} K_{i}^{\prime}=K
$$

(iii) Using the cases (ii)(a) and (ii)(b) $n-1$ more times we find polynomials $x_{1}^{\prime}, \ldots, x_{n}^{\prime}$ and commuting set of locally nilpotent derivations of $P_{n}$, say, $\Delta_{1}, \ldots, \Delta_{n}$ that satisfy (12) and such that

$$
(\alpha) \Delta_{i} * x_{j}^{\prime}=\delta_{i j} \text { for all } i, j=1, \ldots, n
$$

$(\beta)$ the $n$-tuple of derivations $\Delta=\left(\Delta_{1}, \ldots, \Delta_{n}\right)^{T}$ is obtained from the $n$-tuple of derivations $\partial^{\prime}=\left(\partial_{1}^{\prime}, \ldots, \partial_{n}^{\prime}\right)^{T}$ by unitriangular (hence invertible) scalar matrix $\Lambda=\left(\lambda_{i j}\right) \in M_{n}(K)$ such that $\Delta=\Lambda \partial^{\prime} ;$ and
$(\gamma)\left(\right.$ where $\left.K_{1}^{\prime \prime}:=\operatorname{ker}_{P_{n}}\left(\Delta_{1}\right), \ldots, K_{n}^{\prime \prime}:=\operatorname{ker}_{P_{n}}\left(\Delta_{n}\right)\right)$

$$
\begin{aligned}
P_{n} & =K_{n}^{\prime \prime}\left[x_{n}^{\prime}\right]=\left(K_{n-1}^{\prime \prime} \cap K_{n}^{\prime \prime}\right)\left[x_{n-1}^{\prime}, x_{n}^{\prime}\right]=\cdots=\left(\bigcap_{i=s}^{n} K_{i}^{\prime \prime}\right)\left[x_{s}^{\prime}, \ldots, x_{n}^{\prime}\right]=\cdots \\
& =\left(\bigcap_{i=1}^{n} K_{i}^{\prime \prime}\right)\left[x_{1}^{\prime}, \ldots, x_{n}^{\prime}\right]=K\left[x_{1}^{\prime}, \ldots, x_{n}^{\prime}\right]
\end{aligned}
$$

(iv) Replacing the row $x^{\prime}=\left(x_{1}^{\prime}, \ldots, x_{n}^{\prime}\right)$ by the row $x^{\prime} \Lambda$ gives the required elements of the theorem. Indeed, by $(\alpha), \Lambda \cdot\left(\partial_{i}^{\prime} * x_{j}^{\prime}\right)=1$, the identity $n \times n$ matrix. Hence, $\left(\partial_{i}^{\prime} * x_{j}^{\prime}\right) \cdot \Lambda=1$, as required.
(v) Let $x_{1}^{\prime}, \ldots, x_{n}^{\prime}$ be the set of polynomials as in the theorem. Then $\sigma$ is an algebra automorphism (see $(\gamma)$ and (iv)) such that $\partial_{i}^{\prime}=\sigma \partial_{i} \sigma^{-1}=\frac{\partial}{\partial x_{i}^{\prime}}$ for $i=1, \ldots, n$.

Corollary 2.9 Let $\sigma \in \mathbb{G}_{n}$. Then $\tau \sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)$ for some $\tau \in G_{n}$.
Proof. By Lemma [2.6, the elements $\partial_{1}^{\prime}:=\sigma\left(\partial_{1}\right), \ldots, \partial_{n}^{\prime}:=\sigma\left(\partial_{n}\right)$ satisfy the assumptions of Theorem 2.8, By Theorem [2.8, $\partial_{1}^{\prime}:=\tau^{-1}\left(\partial_{1}\right), \ldots, \partial_{n}^{\prime}:=\tau^{-1}\left(\partial_{n}\right)$ for some $\tau \in G_{n}$. Therefore, $\tau \sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)$.

Proof of Theorem 1.1, Let $\sigma \in \mathbb{G}_{n}$. By Corollary 2.9, $\tau \sigma \in \operatorname{Fix}_{\mathbb{G}_{n}}\left(\partial_{1}, \ldots, \partial_{n}\right)=\operatorname{Sh}_{n}$ (Proposition 2.5.(3)). Therefore, $\sigma \in G_{n}$, i.e. $\mathbb{G}_{n}=G_{n}$.
