FERNANDES, Nuno O.; CARMO-SILVA, Sílvio (2017) - Load-based generic polca: performance assessement using simulation. In International Conference of Mechatronics & Cyber-Mixmechatronics, 1, Bucarest, 2017 – ICOMECYME.

ABSTRACT

POLCA (i.e. <u>Paired-cell Overlapping Loops of Cards</u> with <u>Authorization</u>) is a card-based decision support system for production control, developed to support the adoption of Quick Response Manufacturing. Two variants of POLCA have been proposed in the literature to improve POLCA performance: Load Based POLCA and Generic POLCA. In this paper, we combine these two variants into a single production control system and analyse its performance for different backlog-sequencing rules. The results of a simulation study carried out for a make-to-order flow shop, support the strategy of combining these two POLCA variants and show that capacity-slack backlog sequencing based on corrected aggregate load have the potential for improving performance.
