The role cytotoxic T cells play in protecting livestock against *Theileria parva* (Ph.D.Thesis)

Cattle that survive infection with *Theileria parva*, a protozoan parasite that causes East Coast fever, are thereafter immune to homologous challenge for long periods. It is known that immune animals possess cytotoxic T lymphocytes (CTLs), white blood cells that specifically recognize and destroy parasitized cells. However, direct evidence that CTLs are involved in protection has not been reported. To address this question, a limiting dilution micro-assay was developed for determining the frequency of *T. parva*-specific CTLs in cattle before and after exposure to the parasite. The assay was then used to clarify the role these cells play in recovery and protection from East Coast fever.

In one series of experiments, five immune cattle were challenged with *T. parva* (Muguga). Using lymphatic cannulation techniques, it was possible to collect the fluid draining from the infected lymph node and so determine the kinetics of the CTL response generated by this challenge. CTLs were collected at the peak of the response and transferred to a naive, lethally infected twin of the donor. The results demonstrated that these cells are indeed capable of clearing the parasite from an animal.

In a separate experiment, 23 cattle were immunized with either the Muguga stock of the parasite or a cloned population of the immunologically distinct Marikubuni stock, and the specificities of their CTL responses were determined. The susceptibility of these animals to challenge with the reciprocal stock was then evaluated to determine if the specificity of the response can be correlated with cross-protection. The study revealed that CTL specificity was reflected in cross-protection.

The results of these experiments provide further evidence that parasite-specific CTLs play a major role in protective immunity against *T. parva*.

Kenyan ILRAD Research Fellow.

Ph.D. thesis abstract submitted 1991 to the Department of Biology and Biochemistry,
Brunel University,
London.

ILRAD Reports is published quarterly by the International Laboratory for Research on Animal Diseases (ILRAD), in Nairobi, Kenya. The newsletter is written, designed and electronically laid out to camera-ready stage in-house using a personal computer and laser printer. The newsletter is printed in Nairobi by Majestic Printing Works. It has a circulation of 3,000

English and 500 French readers and is available free upon request. Material in the Reports may be reproduced without prior permission, but we ask that credit be given and that two copies of the reprint be sent to ILRAD's Scientific Writer/Editor, Susan MacMillan: telephone: (254-2) 592311, telefax: (254-2) 593499, electronic mail: 157:CG1017.

ILRAD was founded in 1973 to conduct research into better ways of controlling livestock diseases: the current primary goal of the Laboratory is to develop safe, effective and economical methods to control two parasitic diseases that severely constrain animal production in Africa: trypanosomiasis, transmitted to animals by the bite of a tsetse fly, and East Coast fever, a virulent form of theileriosis, transmitted to cattle by ticks. An international staff of about 50 scientists conducts basic research, much of it aimed at the development of vaccines, in the fields of biochemistry, cell biology, electron microscopy, epidemiology, genetics, immunology, molecular biology, pathology, parasitology and the socioeconomics of animal disease control,

ILRAD is one of 15 international agricultural research centres sponsored by the Consultative Group on International Agricultural Research (CGIAR). With a secretariat located in the World Bank, in Washington, DC., the CGIAR is an informal umbrella organization of 40 national governments, international organizations and private foundations that together provide about US\$250 million annually to the centres for research, training and advisory services. The CGIAR aims to increase sustainable production of staple foods in developing countries. The organization emphasizes improving the nutritional level and economic well-being of low-income people while improving the management of natural resources.
