

Epidemiology of Brucellosis in Ruminants: the Basics and Dynamics of the Disease

Professor John B. Kaneene
DVM, MPH, PhD, FAES

Center for Comparative Epidemiology
Michigan State University

Workshop: An Integrated Approach to Controlling
Brucellosis in Africa, Addis Ababa, 29-31 January
2013

Presentation Outline

- ❖ **Basic Epidemiology of Brucellosis**
- ❖ **Reservoirs and Routes of Transmission**
- ❖ **Outbreak Investigations**
- ❖ **Surveillance and Control Programs**
- ❖ **Summary**

Basic Epidemiology of Brucellosis

❖ Host-Agent-Environment

- ❖ Host species: most mammals
 - ❖ Hoofstock: cattle, goats, sheep
 - ❖ Swine and other mammals

❖ Agents: *Brucella* spp.

- ❖ Host preferences, but not specific

❖ Environmental conditions:

- ❖ Allows direct contact with materials contaminated when *Brucella* are shed

Reservoirs of Brucellosis

❖ Reservoir hosts:

- ❖ Host allows pathogen to survive, grow, and multiply without compromising significantly reproduction and survival
- ❖ Maintains infection within their species population
- ❖ Capable of transmitting infection to other species

Reservoirs of Brucellosis

❖ Primary Livestock Reservoirs of *Brucella*

❖ *B. abortus*:

- ❖ Cattle, Buffalo

❖ *B. melitensis*

- ❖ Goats
- ❖ Sheep

❖ *B. ovis*

- ❖ Sheep

❖ *B. suis*

- ❖ Swine

❖ Wildlife Reservoir of *Brucella* in Africa

❖ *B. abortus*:

- ❖ African Buffalo

Reservoirs of Brucellosis

❖ *Brucella* in Africa Wildlife

❖ Bovidae*

- ❖ African buffalo*
- ❖ Bushbuck
- ❖ Eland
- ❖ Impala
- ❖ Kob
- ❖ Lechwe

❖ Bovidae (cont).

- ❖ Waterbuck
- ❖ Wildebeeste

❖ Others:

- ❖ Giraffe
- ❖ Zebra
- ❖ Hippopotamus

* - high potential for reservoir status

Routes of Transmission

- ❖ **Primary Routes of Shedding for Brucellosis**
 - ❖ **Urogenital system**
 - ❖ **Uterine discharges: HIGHLY INFECTIOUS**
 - ❖ **Milk**
 - ❖ **Semen**
 - ❖ **Shedding not constant, consistent**

Routes of Transmission

- ❖ **Routes of Transmission for Brucellosis**
 - ❖ **Ingestion of contaminated materials**
 - ❖ **Contact through**
 - ❖ **Mucous membranes**
 - ❖ **Open wounds**
 - ❖ **Conjunctiva**
 - ❖ **Vertical transmission – questionable**

Maintenance of Brucellosis

❖ Shedding

- ❖ Abortion – reproductive fluids
- ❖ Milk
 - ❖ After abortion
 - ❖ Continue through life of the animal

❖ Transmission

- ❖ Ingestion of milk
- ❖ Ingestion of contaminated materials

Outbreak Investigations

- ❖ **Steps for conducting outbreak investigations**
 - ❖ **Establish and verify existence of outbreak**
 - ❖ Reported cases
 - ❖ Routine surveillance
 - ❖ **Define and identify cases**
 - ❖ Consistent case definition
 - ❖ Laboratory confirmation

Outbreak Investigations

- ❖ **Steps for conducting outbreak investigations**
 - ❖ **Epidemiological Investigation**
 - ❖ **Data collection: demographics, clinical data, risk factors**
 - ❖ **Examination of cases and premises**
 - ❖ **Characterize outbreak**
 - ❖ **Populations affected**
 - ❖ **Geographic extent**
 - ❖ **Dates and Trends over Time**

Outbreak Investigations

- ❖ **Steps for conducting outbreak investigations**
 - ❖ **Formulate & evaluate hypotheses**
 - ❖ **Source of infection**
 - ❖ Primary case
 - ❖ Imported cases
 - ❖ **Modes of Transmission and Exposures**
 - ❖ 'Abortion storms'
 - ❖ Venereal exposure

Outbreak Investigations

❖ Outbreak Control

❖ Control measures

- ❖ Control source of pathogen – Identify infected animals
- ❖ Interrupt transmission – Quarantine, culling
- ❖ Control host response to exposure – vaccination

❖ Monitoring to evaluate effectiveness of control measures

❖ Directed Surveillance

- ❖ Passive and Active Surveillance

Summary

- 1. Brucella spp. have many domestic and wildlife reservoirs**
- 2. Outbreak Investigation is an important tool for studying disease dynamics**

Summary (cont.)

- 3. Establishing surveillance systems is a key to monitoring disease status and planning for control measures**
- 4. In both outbreak investigation and surveillance, use of appropriate diagnostic tests is critical**

THANK YOU!
