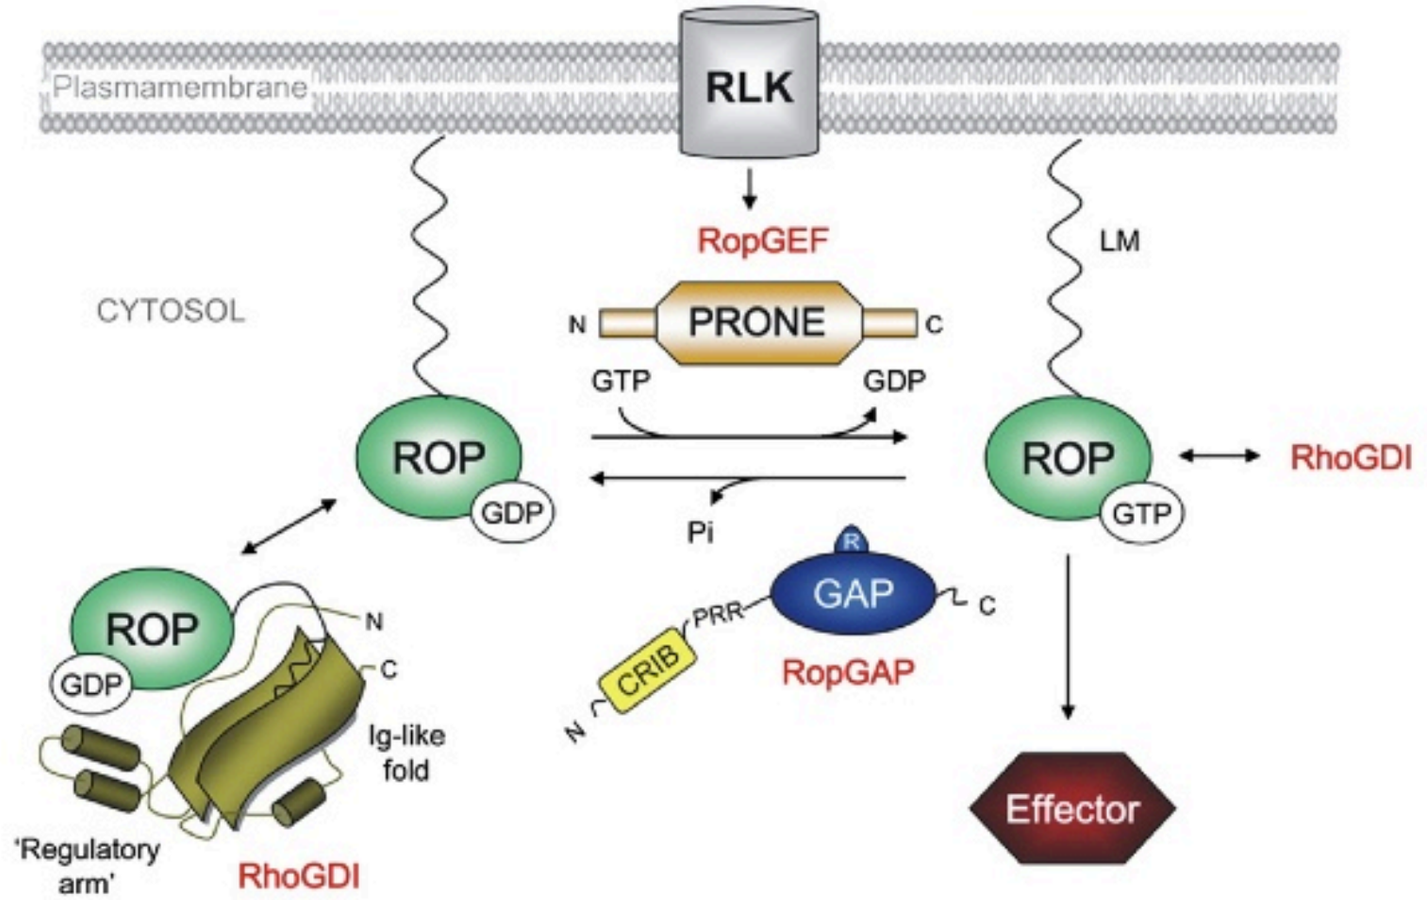
(B) SIGNALING BY GTP-BINDING PROTEIN

Adapted from Alberts Cell

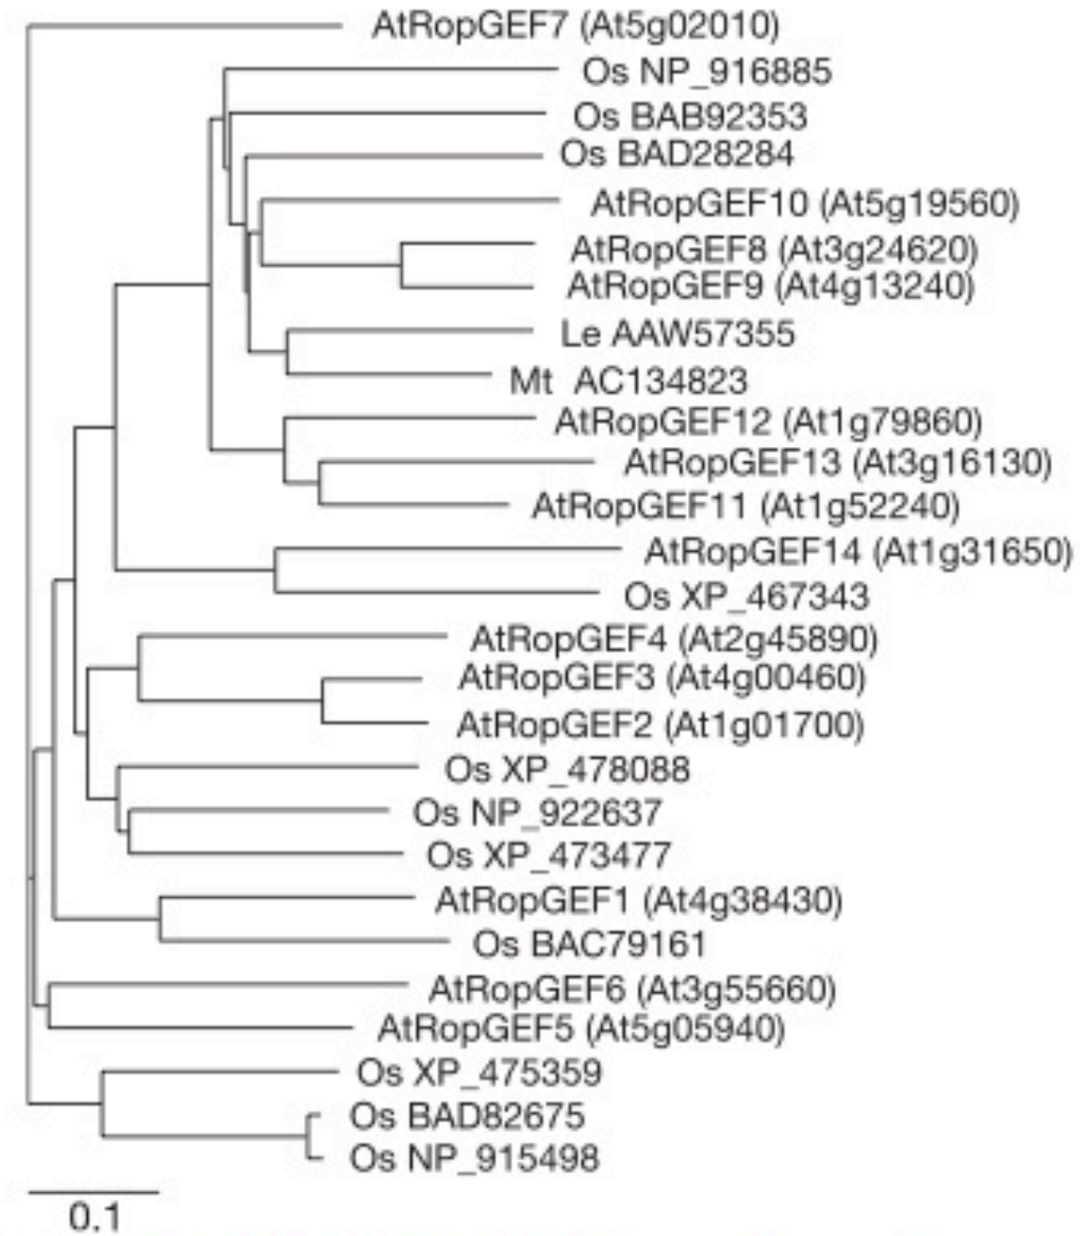
Fig 2 Regulation of Rac activity



Schematic illustration of functionally relevant domains and motifs in the regulators of the ROP cycle. Membrane attached ROPs are activated by RopGEFs via the catalytic PRONE domain promoting GDP/GTP exchange. The GTPase activity of ROPs is stimulated by RopGAPs requiring both a CRIB-motif and a GAP domain with an arginine finger (R) for efficient catalysis (PRR: proline-rich region of unknown function within RopGAPs). RhoGDIs sequester ROPs in the cytosol by hiding the C-terminal lipid-moieties (LM) within their immunoglobulin (Ig)-fold while a regulatory arm binds to prevent GDP dissociation or GTP hydrolysis. Upstream signals can feed into this regulatory cycle via a putative contact between receptor-like kinases (RLK) and RopGEF. Downstream pathways are induced through the interaction of GTP-bound ROP with effectors.

A. Berken, A. Wittinghofer / Plant Physiology and Biochemistry 46 (2008) 380e393

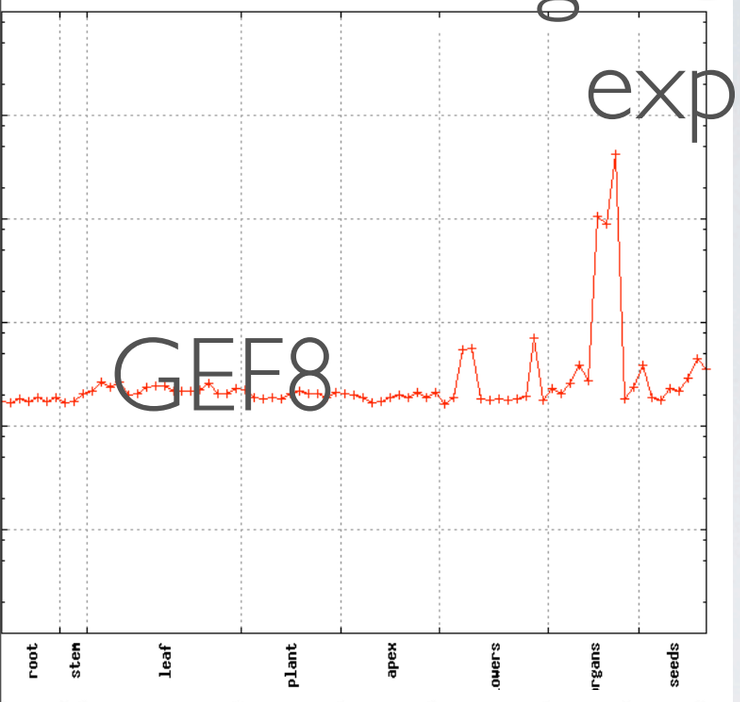
Fig 3 Phylogenetic tree of GEFS in plants

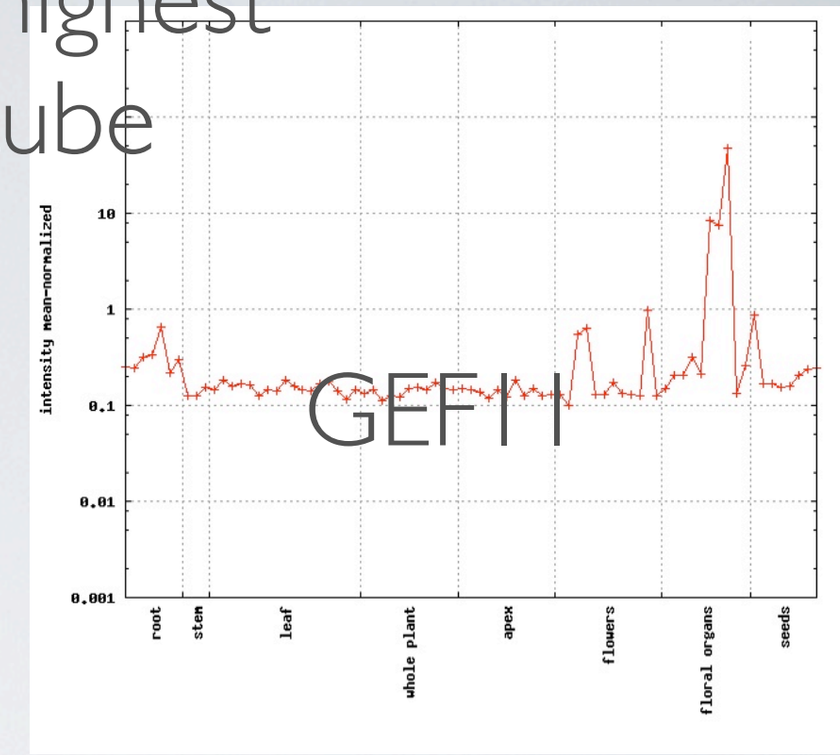


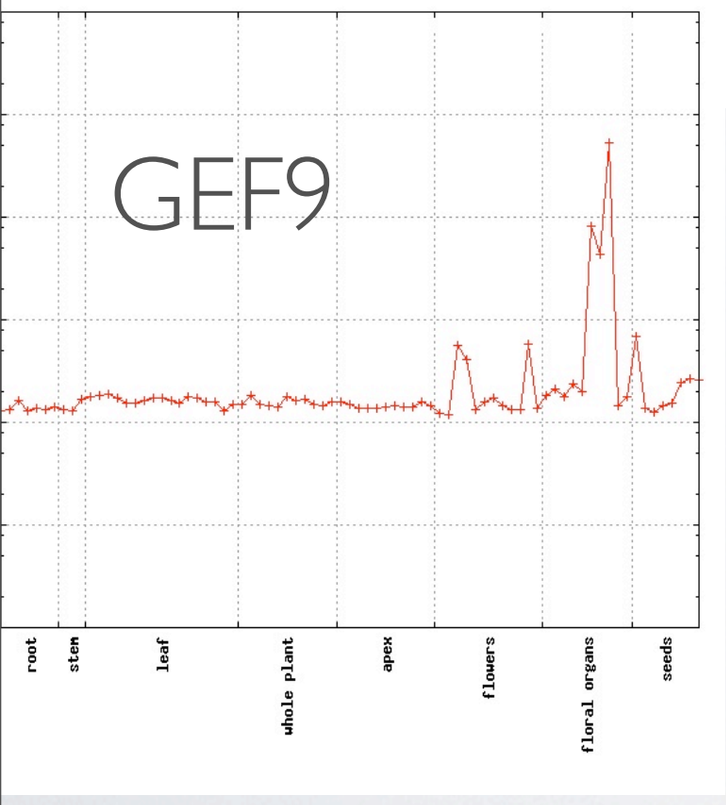
The plant RopGEF family. Phylogenetic tree of sequences obtained from GenBank using BLAST (http://www.ncbi.nlm.nih.gov/ BLAST). Phylogram was constructed with TreeView (http:// taxonomy.zoology.gla.ac.uk/rod/ treeview.html) after alignment with ClustalW (http://www.ebi.ac.uk/clustalw). Arabidopsis thaliana (At) RopGEFs are given with their corresponding loci. The accession numbers for rice (Os: Oryza sativa), the model legume 'barrel medic' (Mt: Medicago truncatula) and tomato (Le: Lycopersicon esculentum) are as indicated

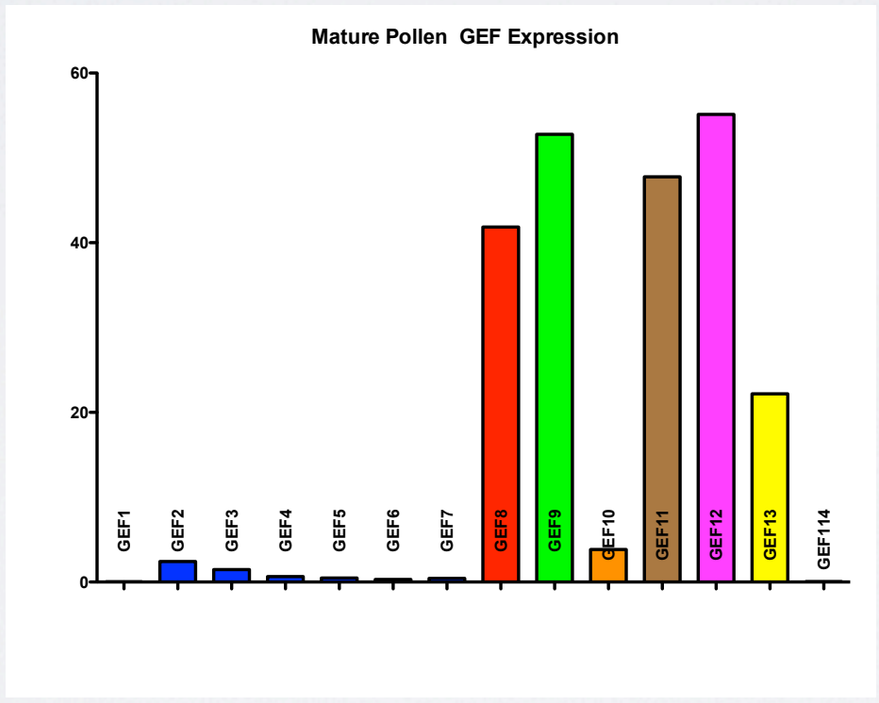
A new family of RhoGEFs activates the Rop molecular switch in plants Antje Berken[1], Christoph Thomas[1] & Alfred Wittinghofer[1]

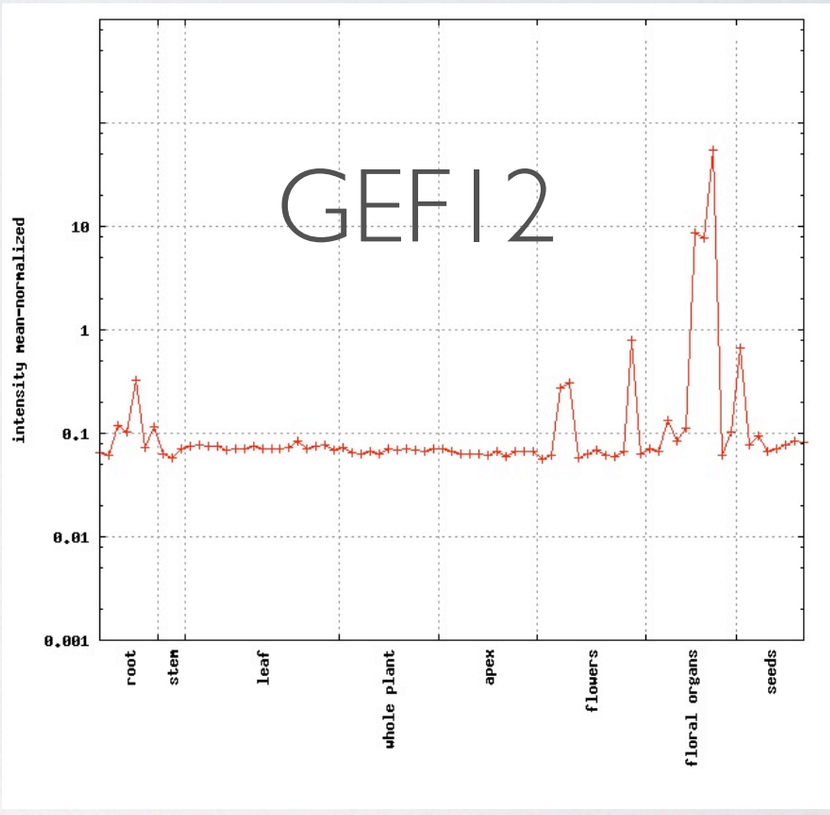
Fig4 GEF8,9,11,12 have the highest expression in the pollen tube







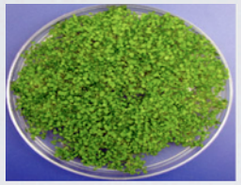




AtGenExpress Visualization Tool (AVT) was used in order to investigate which GEF have the highest expression in the pollen tube

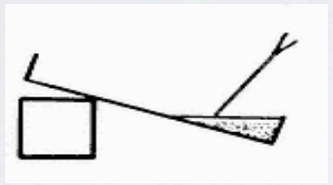
Fig 5 Outline of the experimental procedure for the protoplasts isolation. (see methods section for the details)

✦Cut the 2 week old seedling.

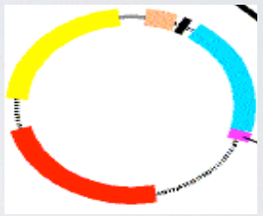


Incubate plants overnight with an enzyme solution in the

Remove the enzyme solution

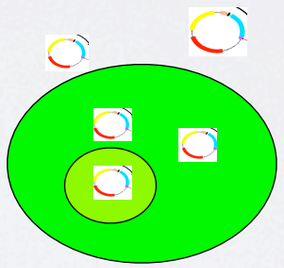


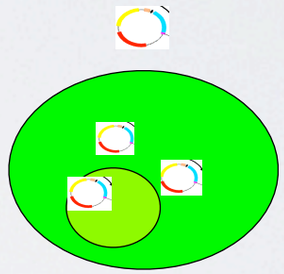
Transform the protoplasts with the construct of interest



Resuspend in K3 sucrose medium

Take the floating intact cells





15 hours later assess the expression of the protein

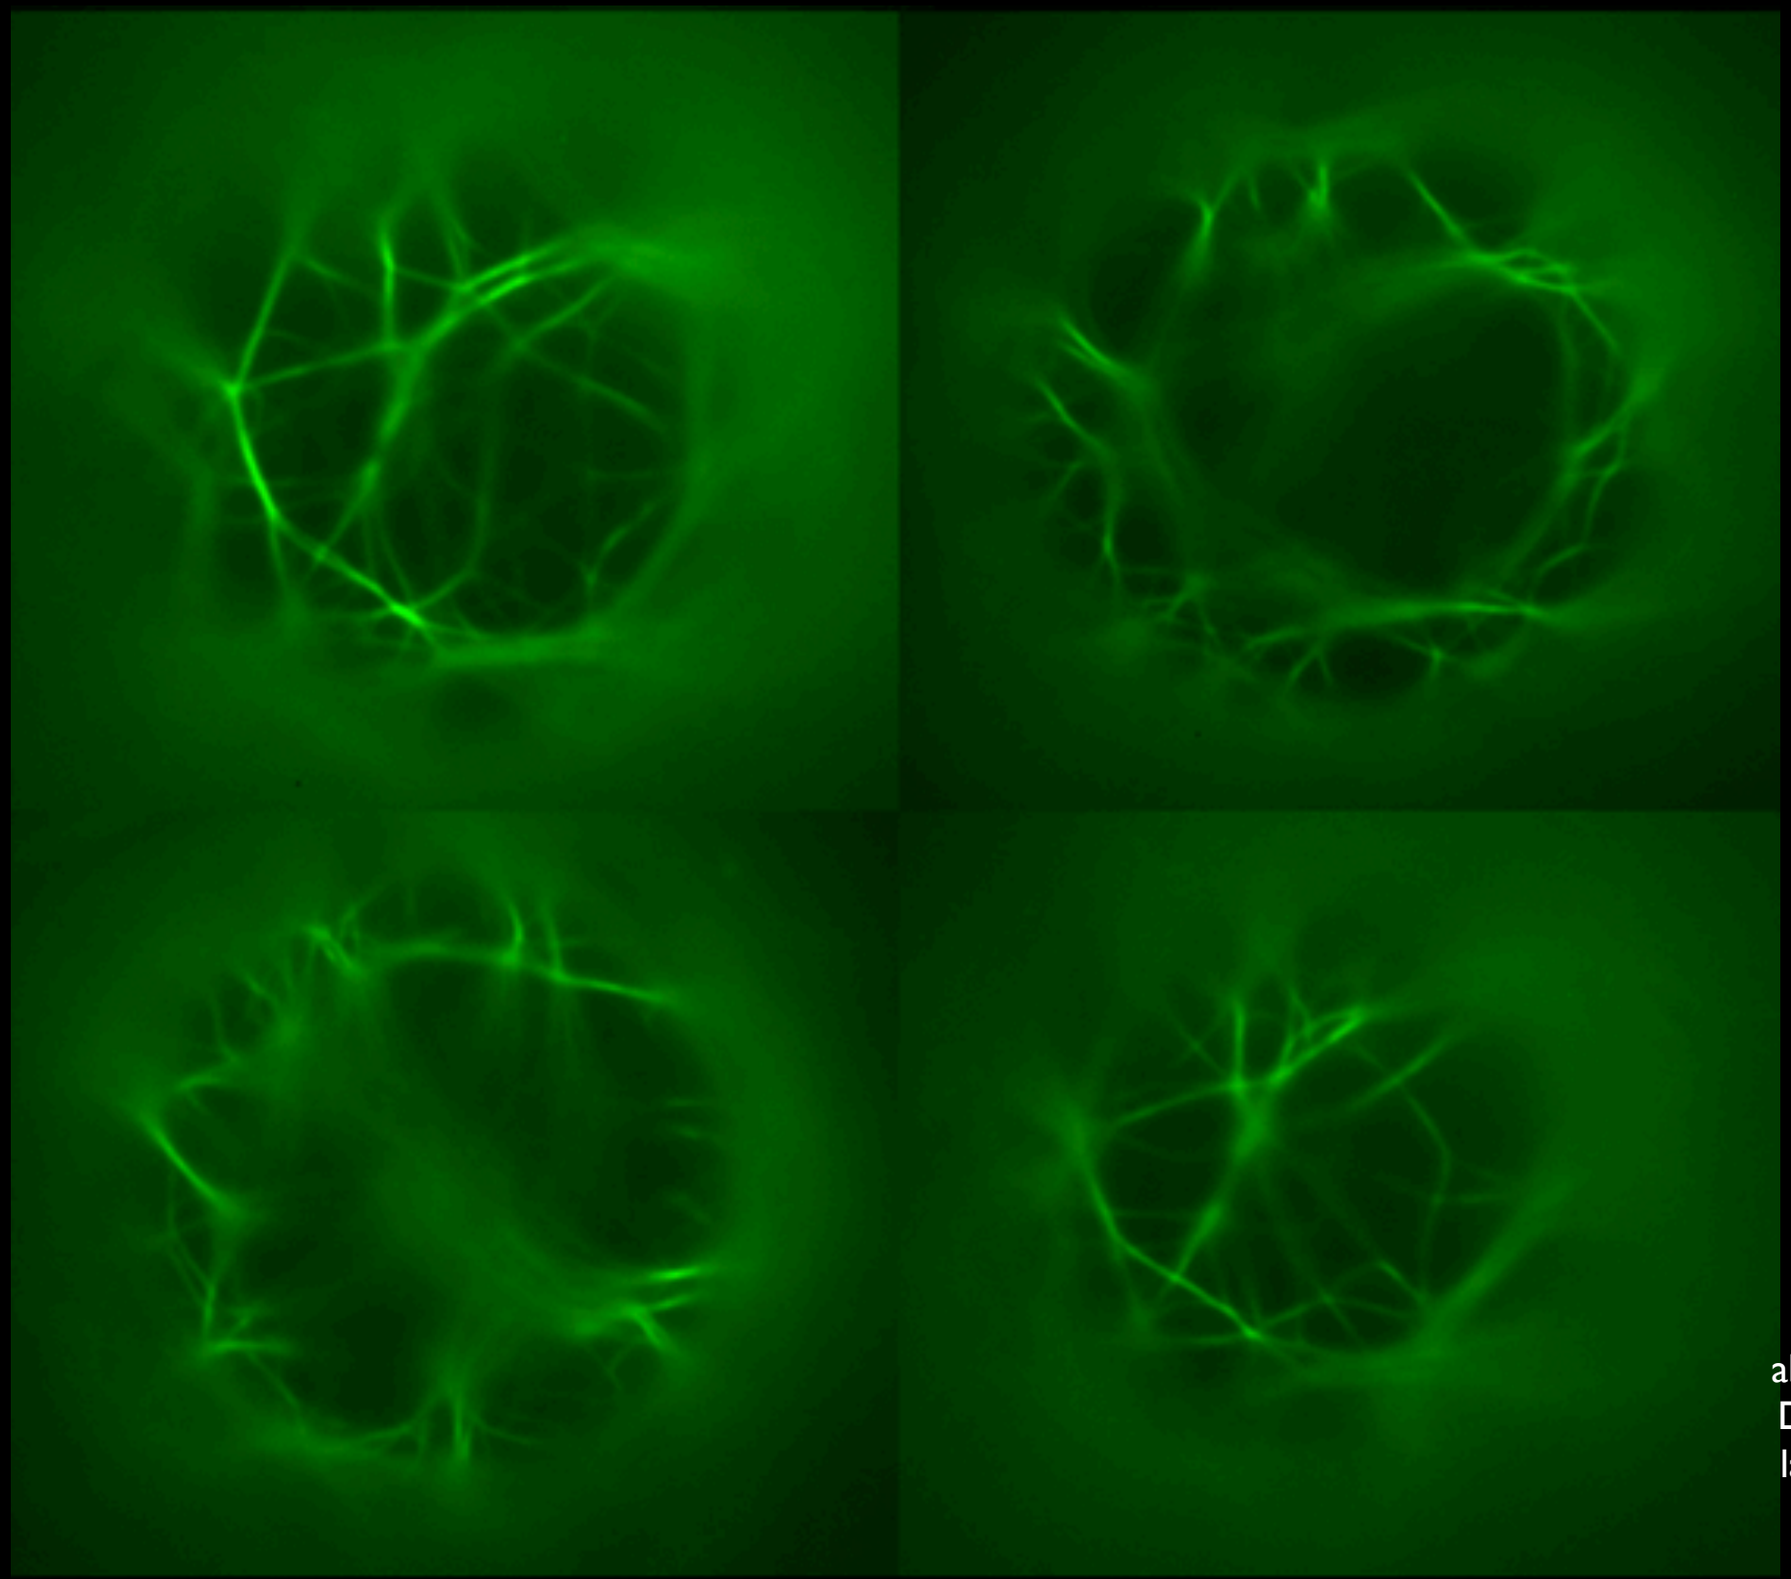
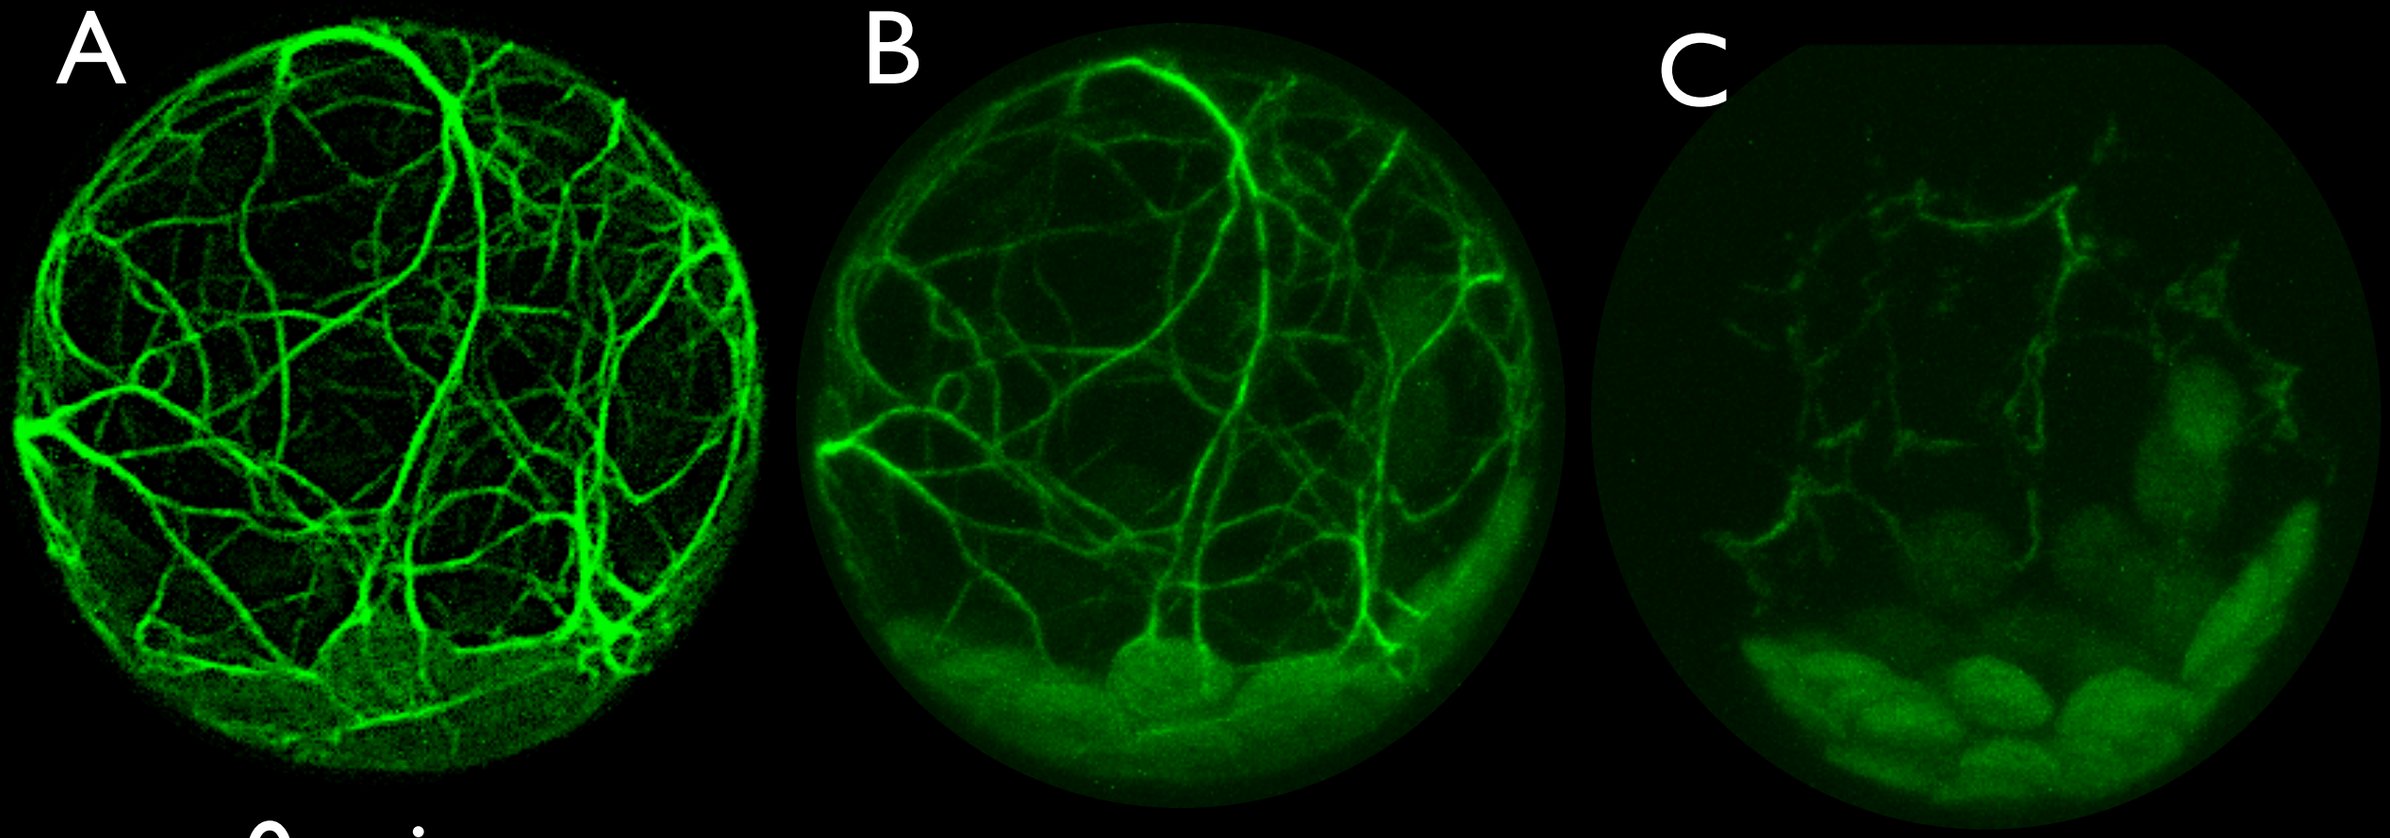
www.escholarship.org/editions/view?docId=ft79...

Fig 6 35S-GFP-GEF8 colocolizes with the prominent cable like structures in the arabidopsis protoplasts



Protoplasts were isolated as described above and transformed with 5ug of plasmid DNA coding 35S-GFP-GEF8. Fifteen hours later the images were acquired using E800 Nikon microscope under 100X magnification

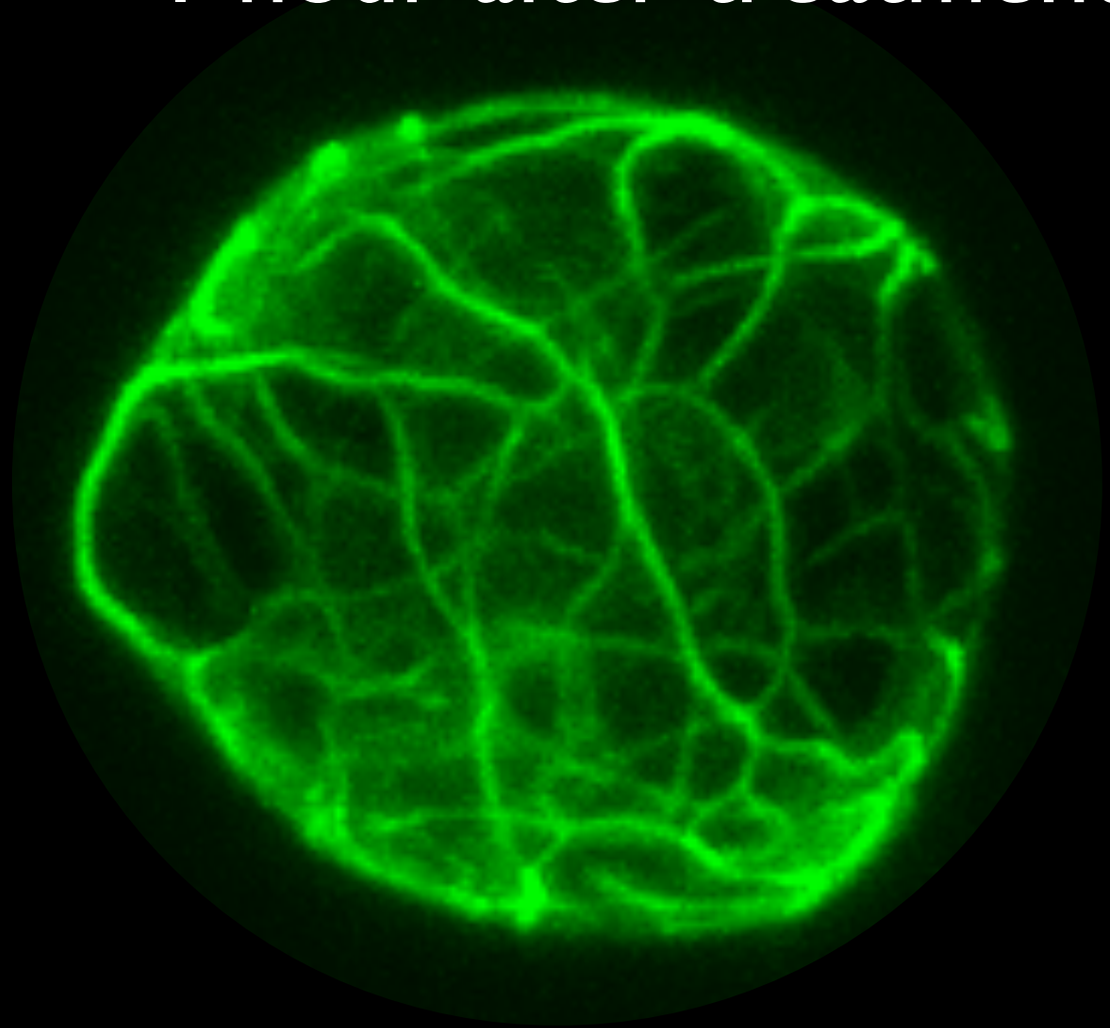
Fig 7 250 nM Latranculin treatment



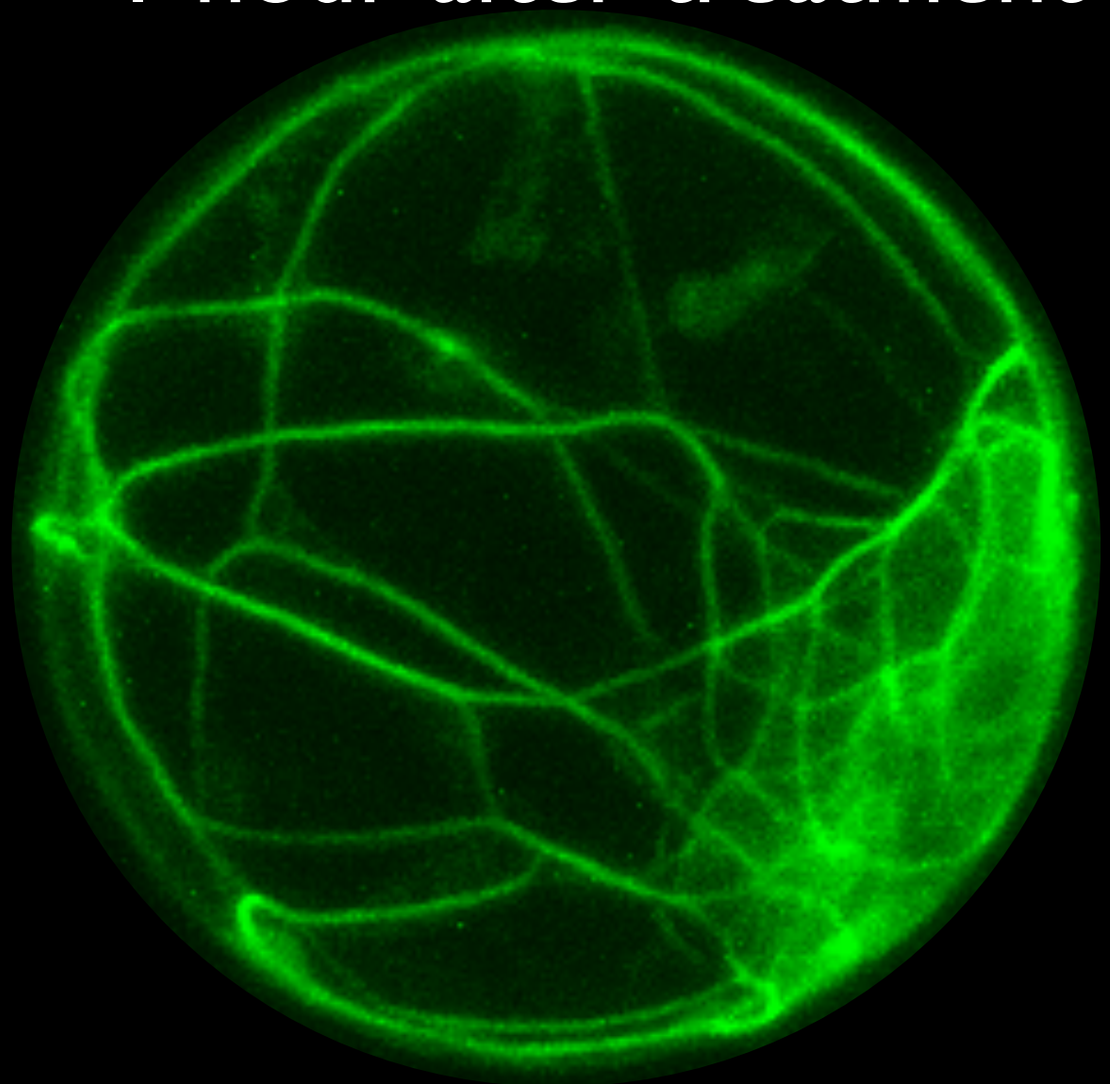
Arabidopsis protoplasts were treated with 250nM concentration of Latranculin and Z stacks of the same cell were taken at 0, 2 and 10 min after the treatment using Confocal Zeiss microscope. Images show the 3D reconstruction of the Z Stacks.

Fig 8 Oryzalin 10um treatment

1 hour after treatment



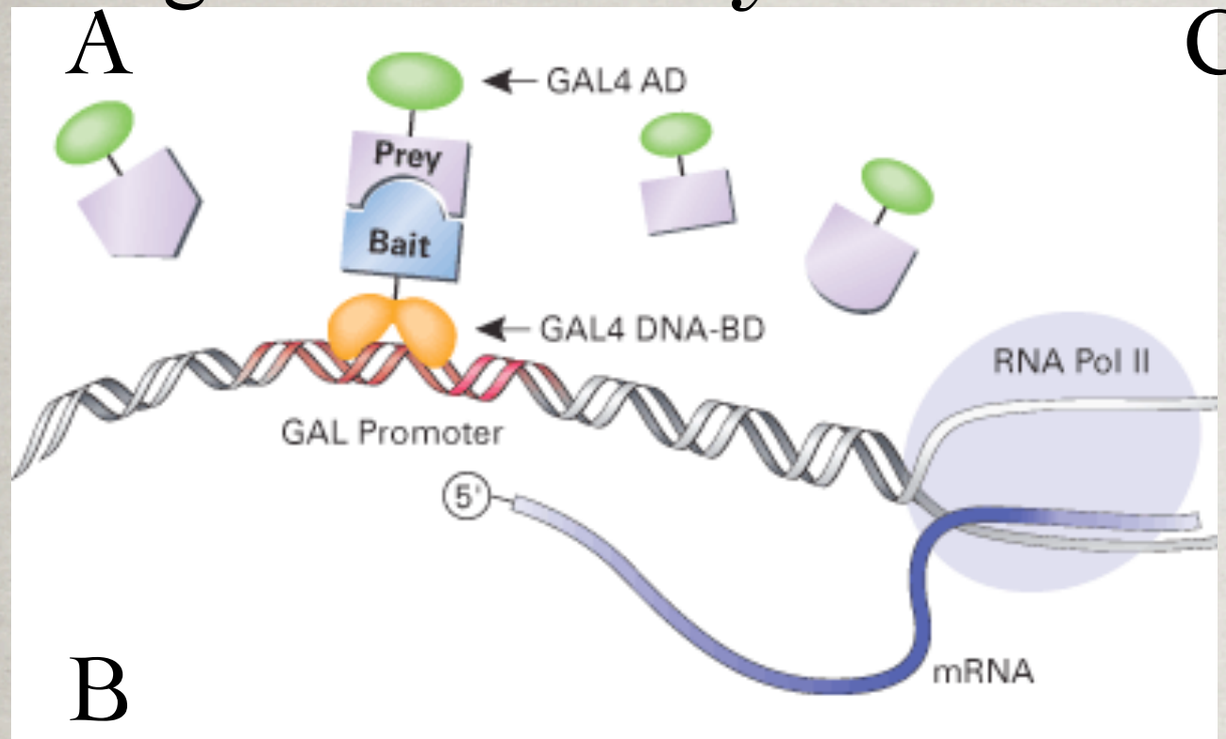
1 hour after treatment



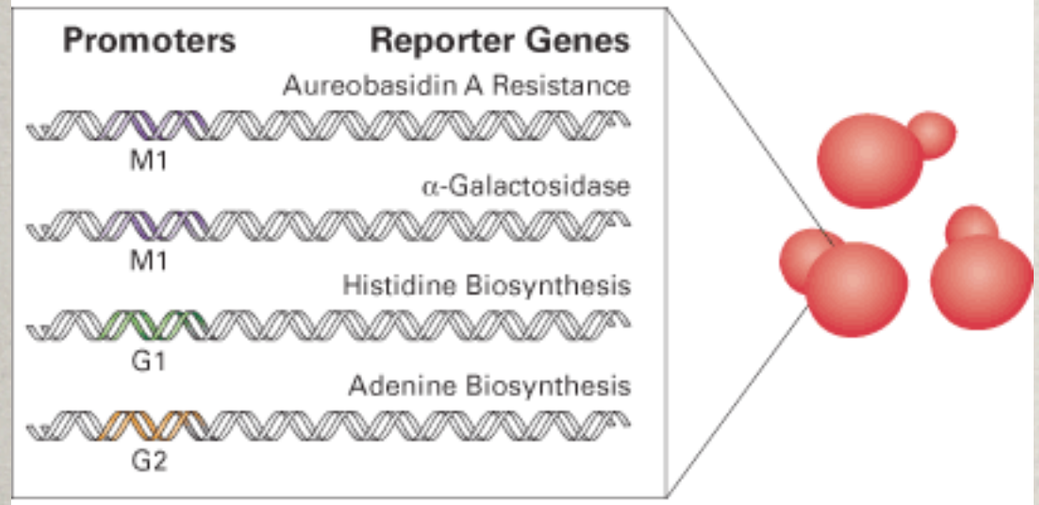
Protoplasts were treated for 1hour with oryzalin and Z stacks were acquired using Zeiss confocal micorscope. Images show the 3 D reconstitution of 2 different cells after !hour of oryzalin treatment.

Fig 9 Yeast 2 Hybrid

A



B



A-The yeast two-hybrid principle. A bait protein interacts with the GAL4 recognition sequence (or promoter) upstream of a reporter gene. Transcription of the reporter is activated when a prey protein containing the GAL4 transcriptional activation domain interacts with the bait.

Adapted from Clontech Yeast 2 hybrid systems manual

B-Matchmaker Gold reporter genes. Yeast strain Y2HGold expresses 4 genes from 3 separate GAL4-responsive promoters in response to protein-protein interactions.

Adapted from Clontech Yeast 2 hybrid systems manual
