LETTER FLUENCY GAMES

NOTE WRITTEN BY:

JOCK GUNTER

SUMMARY:

Letter Fluency games are simple inexpensive devices designed to
offer practice in the component skills necessary for literacy.
In this note a variety of fluency techniques are discussed.

TECHNICAL NOTE SERIES

1. *The Ecuador Project*: Discusses the basic goals, philosophy, and methodology of a rural, nonformal education project.
2. *Conscientizacao and Simulation Games*: Discusses Paulo Freire's educational philosophy and the use of simulation games for consciousness-raising.
3. *Hacienda*: Describes a board game simulating economic and social realities of the Ecuadorian Sierra.
4. *Mercado*: Describes a card game which provides practice in basic market mathematics.
5. *Ashton-Warner Literacy Method*: Describes a modified version of Sylvia Ashton-Warner's approach to literacy training used in Ecuadorian villages.
6. *Letter Dice*: Simple, participatory letter fluency games; a non-threatening approach to literacy.
7. *Bingo*: Describes Bingo-like fluency games for words and numerical operations.
8. *Math Fluency Games*: A variety of simple games that provide practice in basic arithmetic operations.
9. *Letter Fluency Games*: A variety of simple games that provide practice in basic literacy skills.
10. *Tabacundo - Battery-Powered Dialogue*: Describes uses of tape recorder for feedback and programming in a rural radio school program.
11. *The Facilitator Model*: Describes the facilitator concept for community development in rural Ecuador.
12. *Puppets and the Theater*: Describes the use of theater, puppets, and music as instruments of literacy and consciousness awareness in a rural community.
13. *Fotonovella*: Describes development and use of photo-literature as an instrument for literacy and consciousness-raising.
14. *The Education Game*: Describes a board game that simulates inequities of many educational systems.
15. *The Fun Bus*: Describes an nonformal education project in Massachusetts that used music, puppetry, and drama to involve local people in workshops on town issues.
16. *Field Training Through Case Studies*: Describes the production of actual village case studies as a training method for community development workers in Indonesia.
17. *Participatory Communication in Nonformal Education*: Discusses use of simple processing techniques for information sharing, formative evaluation, and staff communication.
18. *Bintang Anda - A Game Process for Community Development*: Describes an integrated community development approach based on the use of simulation games.
19. *Using Consultants for Materials Development*: Describes an approach to selecting and utilizing short-term consultants for materials development.
20. *Designing and Using Simulations for Training*: Outlines steps involved in designing and utilizing simulations. Presents two simulations in detail.
21. *Q-Sort as Needs Assessment Technique*: Describes how a research technique can be adapted for needs assessment in nonformal education.
22. *The Learning Fund - Income Generation Through NFE*: Describes a program which combines education and income-generation activities through learning groups.
23. *Game of Childhood Diseases*: Describes a board game which addresses health problems of young children in the Third World.
24. *Road-to-Birth Game*: Describes a board game which addresses health concerns of Third World women during the pre-natal period.
25. *Discussion Starters*: Describes how dialogue and discussion can be facilitated in community groups by using simple audio-visual materials.
26. *Record-Keeping for Small Rural Businesses*: Describes how facilitators can help farmers, market sellers, and women's groups keep track of income and expenses.
27. *Community Newspaper*: Describes how to create and publish a community-level newspaper in a participatory fashion.
28. *Skills Drills*: How to make and use a simple board game for teaching basic math and literacy skills.
29. *Jigsaw Map Making and Photo/Writing Wrap-Up*: Describes two participatory activities designed for needs assessment of rural communities in Cambodia.

Technical Notes - $2.00 each

Technical Notes 1-14 were produced by staff members of the Ecuador Nonformal Education Project. Each note focuses on a particular issue or technique which has been developed and tested in Ecuador. The notes contain the information available at the time of writing and analytic comments based upon available evaluation data. However, the notes are in no way an evaluation of the project. Their purpose is to share ideas and information about new techniques as they are developed. Project staff want to encourage comments and suggestions from readers who may have had experience with similar techniques in other settings.

The project was financed by USAID and was a joint undertaking of the Ministry of Education in Ecuador and the Center for International Education at the University of Massachusetts. Ideas and materials derived from the ideas were created jointly by staff in Massachusetts and staff in Ecuador. All materials have undergone considerable change in the field as usage in various situations indicated needed modifications. The notes attempt to accurately credit the creators of each technique. In some cases, though, ideas have been modified by a variety of people and precise assignment of credit is difficult. In all cases, various members of the staff have made substantial inputs into the final version of the materials.

After three years of effort the number of people in Ecuador and in the United States who have made substantial contributions to this project is considerable. Rather than trying to enumerate the particular contributions of each, we will only note that this has been a genuine bi-national effort.

Technical Notes from other Center projects will be issued periodically as they are written. A small charge of $1.00 per copy will be made to partially defray the costs of reproduction.
Technical Notes 1-13 are available in both English and Spanish and may be obtained by writing to:

TECHNICAL NOTES

CIE PHILOSOPHY AND APPROACH

The Center for International Education (CIE) is a training, research and service program within the School of Education at the University of Massachusetts. Formed in 1968, CIE offers graduate level professional training and research opportunities in the areas of international development education, nonformal education and global education.

The Center maintains its own publications department printing works of CIE members. All CIE publications are available at cost to organizations and individuals with an interest in international education and development. Publications from the Center are intended to provide valuable information for field-based projects and their personnel,as well as explore specific issues in the field of development education, research and training.

For more information about CIE graduate programs, international education projects or publications, please contact us.

LETTER FLUENCY GAMES

INTRODUCTION

Some of the technical notes in this series have dealt with specific
materials and methods, others with broad issues or more general types
of educational activity. Note Number 6 was devoted to the letter dice
game, the literacy fluency material which has received most utilization
and acceptance in Ecuador. This note will review all fourteen literacy
fluency games and exercises which the project has developed.

Several general issues will be raised. For instance, what range of skills
can be developed with fluency materials? What are the internal dynamics
of successful fluency materials? What is the proper role of fluency
materials in a non-formal literacy program? What degree of profession-
alism should a non-formal education program employ in research and
development of fluency materials? And, how do materials development
decisions influence the direction and control of a project?

Before these questions can be approached, we must first define what are
meant by literacy fluency materials. What are their common character-
istics? How were they developed and implemented within the context of
the University of Massachusetts Non-Formal Education Project in Ecuador?

Literacy fluency materials are structured activities through which
written language is broken down into manageable problems and presented
to the learner for practice. Rather than cope with written language as

a whole, learners can concentrate upon learning and becoming fluent in one component skill at a time. Ranging from letter rummy to word bingo and to the sentence game, the project staff has developed materials for most levels of organization of written language:

Skills	Materials
-to encode a picture or spoken word into its equivalent in written language.	-chulo -concentration -lottery -labelling game -word bingo
-to combine letters into written words. -to decode written words into spoken words.	-letter dice -letter rummy -word trip -letter chips
-to build syllables into written words. -to decode syllables into sounds. -to decode written words into spoken words.	-syllable dice -the Freire game
-to assemble syllables into sentences.	-jigsaw
-to build phrases into sentences. -to decode written sentences into spoken sentences.	-the sentence game
-to encode a string of picture stamps into written stories. -to decode stamped written stories into spoken stories and picture stamps.	-rubber stamp literacy method

The above materials have been designed to be learner-oriented, participatory and self-motivating. Rather than focus upon the actions of a teacher, the literacy materials focus upon the problems encountered by the student. Furthermore, the materials depend upon participation by groups of learners in order to take effect. With learning a reward for

learner initiative and interaction, materials are intended to be self-motivating.[1]

The motivation generated for continued skill practice should not be confused, however, with the broader, more sustained motivation to become fully literate. A learner could conceivably adore manipulating letter dice to discover new words, while having no desire to read books or write letters. Becoming fully literate is a long and tedious process requiring strong and sustained motivation. The development of such motivation depends upon a host of variables beyond the control of the materials developer. The availability of relevant and attractive reading materials, the occupational and status rewards of becoming literate, the dedication and efficiency of the literacy trainers, the design of the literacy program, the belief of the learner and of his peers in their ability to become literate--all these influence the eventual outcome. The literacy fluency materials must be seen in this broad perspective.

FLUENCY MATERIALS WITHIN THE CONTEXT OF THE NON-FORMAL EDUCATION PROJECT

Initially, the project was given a very broad mandate: to foster the development and delivery of meaningful education to rural non-school populations in Ecuador. In this context, a number of constraints were operating to pull the project away from orthodox "expert" approaches to materials development.

---

[1]These characteristics derive directly from the project's educational philosophy, which has been detailed in previous notes in this series.

Operating without the captive audience of school populations, our project would have to rely upon voluntary participation by learners after a hard day's work. A prime criterion for suitable games and exercises would be the ability to attract and maintain the interest and motivation of rural learners. Furthermore, the small size of our staff meant we could only reach significant numbers of rural learners by creating methods and materials which would be adopted by the existing non-school networks delivering education to rural populations. Literacy training became a project concern because of value placed on literacy by non-school rural learners themselves, and by the institutions created to serve them.

The project's approach to materials development for literacy was the opposite of that of the literacy expert. The central question was what kind of materials will the learners enjoy using? What kinds of materials really stood a chance of being adopted and implemented by rural non-school institutions? Until materials could be developed which would succeed in these objectives, questions of this nature would remain unanswered.

On the other hand, the literacy expert would have evaluated learner behavior to ascertain the most efficient techniques for producing literates. He then would have been confronted with the problem of selling the learners the technique which he knew to be "best for them." Our project has felt that we could never know what was best for the learners. We questioned the value of teaching literacy for literacy's sake, and focused upon broader educational aims which literacy might serve.

Simultaneous development of materials for various content areas maintained this broad focus. Fluency games teaching market mathematics, simulation games for insight into social and economic processes, and materials encouraging self-expression were important parts of the materials development effort. The main philosophical thrust of the project's approach to literacy was derived from the self-expressive methods of Sylvia Ashton-Warner and Paulo Freire. The overall aim of literacy training would be self-expression, self-esteem, and conscientization. These goals seemed far more sound and realistic than raising expectations about occupational advancement or increased availability of information or entertainment. In Ecuador, job opportunities for peasants do not increase with literacy. Reading cannot be considered useful for information or entertainment, since there are virtually no reading materials in Ecuador which are produced for peasant audiences or with peasant circumstances in mind.

Both Freire's and Ashton-Warner's approaches to literacy, however, were soon seen to be lacking comprehensiveness in guiding the illiterate's efforts. Freire concerns himself with the importance of learning and discussing "generative words," words from which can be drawn insights into social, economic and political realities, and strategies for dealing with them. Freire is concerned with the importance of the world of written symbols to the process of conscientization and cultural action for liberation. He does not dwell upon teaching the specific skills under which lie competence in dealing with written symbols.

Nor does Sylvia Ashton-Warner's method deal adequately with the structure of written language. Initially, learners are asked individually what words are most important and powerful for them. These "key words" are written upon cards and delivered to their "owners" for study. Learners practice writing their key words, teach their words to other interested learners, and gradually develop their own "key vocabulary." These vocabularies are used to write sentences and stories, which are shared with the other learners.[1]

Both these approaches focus upon the word. One deals also with the sentence and the story. Neither one, however, addresses the other levels of organization of written language - letters, syllables and phrases - which the learner must master in order to use it as a means of expression or liberation.

Can a learner either read or write a "key word" without first knowing which letters represent which sounds? There is nothing about the shape of the letter "a" that tells you what sound it represents. This must be learned and practiced. One may require extensive practice in discriminating between letters in order to tell a "b" from a "d". It may be equally necessary to practice the building of words from letters or syllables before a learner can read "generative words" at all, much less build one's own "key words" into expressive statements.

---

[1] The major difference between Freire's and Ashton-Warner's approach is that the latter values self-expression on the individual level in written form. Freire's prime educational outcome is heightened political conscientiousness and cultural action on the class level.

Freire does not concern himself with the higher levels of organization of written language. Ashton-Warner assumes that once a key vocabulary has accumulated, learners will begin to express themselves by writing sentences and stories. Our project has wondered whether undirected composition may not depend upon fluency in combining letters into syllables, syllables into words, words into phrases, phrases into sentences, and sentences into paragraphs.

Thus, while Freire and Ashton-Warner limit themselves to the holistic view of literacy as a tool for self-expression or cultural action, the non-formal education project sought to undergird these approaches with nuts-and-bolts games and materials to teach and reinforce concrete, component skills required for literacy. The fluency materials developed as a result of the project's belief that competence and familiarity with the mechanics of written language are a necessary prerequisite for its expressive uses.

FLUENCY MATERIALS AND THE LEVELS OF ORGANIZATION OF WRITTEN LANGUAGE

Below are detailed the levels of written language. On the left are lines representing bridges in skill level taught and reinforced by the various fluency materials. Letter dice, for example, are represented in the line which links level one (letters) to level three (words). To the right of the column are links not established by the project materials:

LEVEL OF ORGANIZATION OF WRITTEN LANGUAGE

6	CONVERSATION - STORIES
5	SENTENCES
4	PHRASES
3	WORDS
4	SYLLABLES
1	LETTERS
0	SOUNDS - PICTURES
Lines to the left of the column show that the project materials have tended

to focus most on words. They tend to bridge more than one level of

written language. The lines to the right of the column tell us that

skills on the lowest and highest level have not been covered by fluency

materials. Neither the expressive methods (Freire, Ashton-Warner) nor

the fluency materials provide for learning and practicing the association

between a given sound and its corresponding letter. The differences

between consonants and vowels, the ways in which the two types of letters

combine to form syllables, are also left uncovered by fluency materials.

Failure to master these basic skills could assure a learner of failure

in attempts at more difficult tasks like deciphering written words. The

project's store of fluency materials should certainly contain exercises
which deal explicitly with these skills.

Within the range of skills which are covered by the fluency materials,
there has been a concentration of effort on certain levels of written
language. The various methods, grouped according to which levels they
deal with, are listed below:

PICTURES INTO STORIES (level 0 to level 6)

rubber stamp literacy method

SOUNDS OR PICTURES TO WORDS (level 0 to level 3)

lottery
labelling game
word bingo
chulo
concentration

LETTERS INTO WORDS (level one to level 3)

letter dice
letter rummy
word trip
letter chips

SYLLABLES INTO WORDS (level 2 to level 3)

syllable dice
the Freire game

SYLLABLES INTO SENTENCES (level 2 to level 5)

jigsaw

PHRASES INTO SENTENCES (level 4 to level 5)

the sentence game

From the above, we can conclude that there are striking similarities
among most of the materials. For example, 12 of the 15 literacy fluency

materials deal with the encoding and decoding of words. Eleven of the fifteen bridge more than one rung on the ladder of organization of written language.

The materials were not designed to embody hidden assumptions about how literacy training should be conducted. Rather, materials were designed intuitively, with more emphasis upon what types of exercises and games would appeal. If materials could be produced which could physically reach and emotionally involve learners in non-formal education settings, their efficiency in producing cognitive gains could be evaluated and improved at a later date.

We may now have reached the point where it is time to recognize and examine the assumptions hidden in existing fluency materials. Is the word the best unit of written language for materials to focus upon? Would some learners progress more rapidly with a range of materials which built from one level to the next higher level of organization only (syllable dice vs. letter dice)? There has been some call for the project to answer these and other questions through research, to then assemble a proven sequence of fluency materials to guide the learner from illiteracy to complete literacy. The project's reactions to these ideas will be taken up later in this paper.

FLUENCY MATERIALS AND LEARNER INITIATIVE

Another way in which the fluency materials vary is the degree to which the learner must make decisions and act in order to succeed. In some

cases, players respond to one stimulus with a series of decisions and actions. In other games and exercises, there is only one correct learner response demanded for each stimulus from the game.

In some extreme cases, the nature of the response is largely determined by luck rather than by conscious action on the part of the learner. In the gambling game el chulo, for example, the player's only conscious decision regards which of his cards containing animal names he will place on the game board. The game leader then throws three dice whose faces contain pictures of animals. The player's only other action is to decode the name of the animal he has bet upon, and to compare it with the animal pictures which emerge, in order to see whether he has won. The player's role is passive, simple, and non-threatening.

Another game which demands little active participation of the learner is lottery. In this game, up to six players receive game boards each containing 12 pictures representing common words. The game leader shuffles a deck of cards containing the written equivalents of the 72 pictures on the players' boards. The leader holds up cards. Players respond by pronouncing the word, and claiming those words identifying pictures they have on their boards. The claimant receives the card and places it on the appropriate square of his game board. The first person to fill his board wins the game.

This game places the learner in an even less threatening role than el chulo. The learner who does not know how to read a card that the group leader holds up will be able to hear members of the group shout it aloud.

He then has only to compare a known oral word with recognizable pictorial representations of common words on his game board. When he does receive a word card, he will have the opportunity and the motivation to study it, and learn it. The more advanced learner, on the other hand, can try to decode each card for himself, as it is held up by the facilitator.

The concentration, although quite similar to lottery, gives control of stimuli to the learner. The common game of concentration has been altered only by changing the nature of the pairs. A pair consists of one card with a picture of a common word, and one card with the written word itself. The cards are shuffled and laid out face down in rows and columns. The first player first turns over one card and then turns over another, hoping for a pair. If he gets a pair, he takes the two cards. If he does not get a pair, the two cards are placed face down again. All contestants try to remember the location of the cards they have seen as the next player takes his turn. Players' ability to find pairs derives from knowledge of written words, from memory and from luck. In this case (unlike lottery) one's luck depends upon one's own action (which cards one happens to turn up) and not from the actions of a group leader.

An extreme in non-involving and non-threatening fluency exercises is the labelling game. Learners simply label objects in their village environment with their written names. One might hang a sign reading "store" on the village store, a sign reading "tree" on a large tree, and so forth. People who pass by the labelled tree or store may or may

not choose to look at and decode the written word. The answer to the problem represented by the written word is obvious, since the learner knows that objects in the community are being labelled, recognizes the object in question, and knows (orally) its name. This represents the extreme in effortless, incidental learning.

On the other end of the spectrum are materials which demand a chain of responses from the learner. The best known of these is the letter dice. The learner controls the game's stimulus, in the sense that he is the one who throws the dice. Then he is called on to assess the letters that turn up, to decode them into sounds, and to attempt to assemble as many words as possible, drawing upon his passive memory of spoken and written words. One would have to venture far above the level of sophistication of both this paper and of the project literacy approach to analyze the chain of mental operations necessary to assemble an inventory of letters into various words. For each word the learner attempts to form, he must engage in a search strategy. Exploratory rearranging and decoding of a few letters might suggest sounds reminiscent of a word the learner knows. Repeating that word, the learner may get a sense of what sounds are missing from his creation, and then search for the letters which represent those missing sounds. As he tries (successfully and unsuccessfully) to form words, he will gain a mental "feel" for what sounds are present in his inventory of letters. To a single stimulus, the learner responds by initiating a complex chain of mental operations.

The letter rummy game is simply the 66 faces of the 11 letter dice

transferred to 66 cards. Nonetheless, the activities of the players are quite different from those in the letter dice. Players are dealt five cards, which they hold hidden in their hands. The first player draws a card from the deck. If he is able to form a word, he places the appropriate cards face down in front of him, and discards a card. If he has not been able to form a word, he simply discards. The next player then draws, and tries to form a word and discards. The first player to get rid of all the cards in his hand is the winner--providing that the words he has spelled prove to be correct.

The dynamics of this game are quite different from those of the letter dice. Instead of one player playing while the others spectate, the letter rummy game provides that all participate equally as players. Instead of confronting a player with 11 letters from which he must form as many words as possible, the letter rummy game never asks players to deal with more than six letters at a time. The goal is less ambitious as well, to form words once from a changing store of letters. The pace is slower, too. Each player has time to think, to decide which letters should be kept and which letters discarded, while his companions take their turns. As a result, the letter rummy game may be less threatening than dice, more suitable for learners without much self-confidence. On the other hand, the letter dice game always involves a group activity within which help is at hand for the player who is not completely sure of what he is doing. In the letter rummy game, in contrast, each player is on his own. At the end of the game, the words he has placed in front

of him will be opened to the other players' scrutiny.

A middle ground between the stimulus-response mode and the open-endedness of the letter dice and cards is offered by the syllable materials; the Freire game, a card game analogous to letter rummy, and syllable dice. Carlos Poveda, Head of the Adult Education Division of Ecuador's Ministry of Education, has held that the syllable is more appropriate as a basic unit than the letter. The dice with which he has experimented include only syllables and lone vowels.

Sr. Poveda has excluded lone consonants from his game. His reasoning is that, since consonants can only be pronounced when preceded by or followed by a vowel, they remain meaningless abstractions in isolation. Furthermore, sequences of consonant letter dice are unpronounceable. All sequences of syllable dice, however, can be pronounced. For these reasons, Sr. Poveda believes that syllable dice lead to less confusion and failure, more success and positive reinforcement than letter dice.

It is certain that with syllable materials the chances are greater that a student's efforts will lead to the formation of a word. While a learner has to gather together four letter dice to form the word "casa", only two syllable dice are required. In order to provide even higher probabilities of success, syllable dice have been color-coded according to difficulty. Syllables are distributed on the faces of the initial two red dice in such a way that any throw of the dice yields two syllables that can be formed into a common word. The next four dice are of a different color, and contain syllables which offer good chances of

forming additional numbers of common words. The rest of the dice are in yet another color. Adding these to the game permits the formation of most words in the Spanish language, but this at the cost of introducing many combinations of rare syllables that do not form words. In this way, a learner can control the difficulty of the task he undertakes, graduating to more complicated games by adding dice.

As stated initially, the concept behind a fluency game is that of isolating certain component skills of literacy for practice, while temporarily leaving aside other skills. The aim, in even the most demanding of fluency materials, is to help the learner avoid the often overwhelming confrontation with the entirety of written language at once. Problems are broken up into bite-sized portions.

One problem which is avoided by almost all of the fluency materials is that of writing, of manipulating a pencil in order to encode oral language into written language. With the exception of word bingo, all fluency exercises and games allow the learners to form words by rearranging printed symbols.

There is a very practical reason why the skill of writing is left out of most fluency materials. Many of the learners working with the non-formal education project either never learned to write correctly, or have long since lost their abilities with a pencil. Learning to use a pencil proves to be a very difficult psychomotor task, a task which is best taken on in isolation from other tasks, and after one has accumu-

lated a powerful motivation to express a number of words which one has already learned to assemble with the use of fluency materials. Since writing is not integral to the skills of encoding and decoding written language, the project has decided to let learners tackle the problem of writing largely at their own pace.

The word bingo game, the one fluency game which does not involve writing, asks the student only to copy a word which is directly before him. Each player has a bingo board, containing a configuration of written words, and a blank space next to each word. The facilitator holds up a card with a written word on it. The players scan their boards to see whether that word is present. Those players who have that word must copy it in the blank space next to the word on their boards. The first player to fill a straight line with written words wins. This game requires the most learner participation in the sense of requiring production of written words on paper. Nonetheless, it does not escape from the one stimulus-one correct response format.

THE RUBBER STAMP LITERACY METHOD

We have seen that fluency materials have certain basic characteristics: They allow learners to manipulate an existing store of visual and written symbols, instead of demanding that he write. They operate at certain levels of organization of written language and exclude others. They determine a role for the learner along a continuum whose extremes range from trying to produce a correct response per stimulus on the one hand, to undertaking a series of decisions and actions in response

to one stimulus on the other. There is one fluency method which encom-
passes all of these characteristics.

The rubber stamp literacy method derived from pictorial rubber stamps,
which were first introduced to the project by Dwight Allen, Dean of the
School of Education, who had used such stamps with illiterate villagers
in India. Dean Allen's aim was to offer illiterate villagers a tool
with which they could express themselves on paper.

For literacy training, a pictorial vocabulary can offer a perfect bridge
from oral language to written language. An articulate pictorial state-
ment enables the total illiterate to glean meaning from symbols on a
piece of paper. In addition to psychologically preparing him for written
language, pictorial statements can be a very practical tool for helping
the illiterate and the semi-literate to decode written language. When
we attend a movie in a language we know very little of, we can use the
English subtitles to learn more about the foreign language. In like
manner, illiterates and semi-literates might be able to use pictorial
"subtitles" to written language in order to learn.

The key to such a system is pictorial stamps which are clear and which
elicit a standard response in spoken words from learners. A stamp
representing a house must <u>look</u> like a house to learners, and must have
the ability to <u>elicit</u> the spoken word house from learners consistently
and unfailingly. In order to achieve this, pictorial stamps must be
validated at the local level. When found lacking, they must be revised
until effective.

Production of stamps at the regional level is a realistic possibility, which would allow for response to local cultures and for successive revision of pictorial stamps. Stamp production depends upon access to machines used in making newspaper plates, and an investment of $400 in a heat press. Thus, it could well be possible for national literacy campaigns to finance stamp production facilities in most provincial capitals. Once a visual vocabulary of common words is available, they can be used in conjunction with letter and syllable stamps to cover the entire range of teaching and fluency tasks.

To illustrate, I will propose how the lowest levels of organization of written language might be introduced to a group of Spanish-speaking illiterates. The group facilitator might begin by stamping a picture of a house onto a piece of paper and asking the group what they saw. When they responded "house", he could take the syllable stamp "ca" and stamp it directly under the left side of the picture:

CA   _
He might next introduce the stamp of a bed, and ask the class what they say. When they responded "cama", he could take the same "ca" stamp, and make an impression below the left half of the bed:

CA   _
He could then ask if the learners perceived any similarity between the two words. (If he wanted to involve the learners more actively, he could simply deal with the two picture stamps. Only after they had perceived the similarity in sound, would he stamp "ca" under the left half of both pictures.)

Whichever of the two strategies were used to introduce the syllable "ca", the resulting displays could be left taped to the wall of the building, where learners could refer to it at their leisure. The displays would serve as a self-contained statement which would have meaning to the beginning learner, once the notion had been established that pictures and letters are being used to represent the same known commodity, oral words.

In a strict sense, such visual-written "equations" are not fluency materials, but rather teaching materials. However, once the syllable "ca" had been taught and reinforced sufficiently, learners might begin to manipulate the stamps to produce their own equations or statements. When learners begin to rummage through the pictorial vocabulary in search of pictures to stamp above "ca", the stamps can be said to have become fluency materials. At this point, they are manipulating symbols to consolidate, reinforce, and practice knowledge which has been taught.

Of course, the entire range of established fluency materials can be produced from a picture, letter and syllable stamp set. With various stamp pads, symbols can be color-coded to enhance and complicate fluency games. In fact, the project director reports that the last facilitator

training session offered rubber stamp game production facilities to
facilitators rather than presenting them with a set of fixed fluency
game versions. Facilitators were given an opportunity to participate
in the creation of the materials they would use in their communities.
In addition to gaining a greater stake in the success of the materials,
they gained experience in working with basic building blocks of symbolic
meaning. In all likelihood, this would help them see a game not as an
inviolable creation of far-off literacy experts, but rather as a flexible
and rather arbitrary combination of basic units of meaning.

Just as the stamps can be used to teach, reinforce and offer practice
with the syllable "ca", they can also deal with a vocabulary of syllables,
combinations of syllables into words, of words into phrases, and so on
up the levels of organization of written language. For example:

CA _   MA   NO

CA   MA
There would be limits to the expressiveness of pictorial stamps. It
may prove very difficult to portray verbs, prepositions, adjectives,
adverbs, etc ., in pictorial symbols. However, the aim of the stamps
is not to translate great works of literature into pictures, but rather
to provide a smoother entry into written language for the beginning
student. Insofar as pictures can be created which will suggest meaning

to illiterates, it becomes possible to convey the concept that written
language communicates meaning, and to offer a key to the code of written
language.

Although a rubber stamp literacy method deals with the nuts and bolts
aspect of literacy, its underlying message to the illiterate is that the
purpose of written language is expression. For this reason, a rubber
stamp kit should be of interest to Freire and Ashton-Warner, both pro-
ponents of literacy for expression. Insofar as pictorial stamps can
represent "generative themes" or "key words", they can be of direct use
to the practitioner of expressive methods. At the same time the house
stamp is used to introduce the syllable "ca"; the meaning of the house
in family life can be discussed. A follower of Freire might lead a
dialogue on the question of which social groups live in which kinds of
houses. A follower of Ashton-Warner might ask how learners feel about
their houses, and why their home is important to them. With proper
development, this comprehensive method could serve both the fluency and
the expressive aspects of a literacy training project.

In order to maximize fluency and expressive results, formative evalua-
tion should be applied to the entire rubber stamp method. Pictorial
vocabulary would be evaluated not only for clarity (consistent ability
to elicit the corresponding spoken word) but also for expressive power.
A number of exercises for introducing and reinforcing skills at each
level of organization could be evaluated one against the other. Different
mixes of fluency and expressive work would be compared. The result would

be a menu of proven exercises and techniques with which each facilitator would be equipped.

EVALUATION OF FLUENCY MATERIALS

As stated above, the project has come under pressures, both external and internal, to evaluate the effects of its fluency materials, and to use the results of this evaluation to assemble packages of sequenced materials of proven efficiency. AID has argued that these procedures would make the results of the project more useful to Ecuadorean institutions, and more exportable to other parts of the world. Internally, some of the project staff have felt that although the materials' appeal can be evaluated according to their acceptance by learners, the materials' educational effects will remain unknown until more rigorous evaluations are undertaken.

Those project staff members whose background is not education, those who grew up in rural Ecuador, see themselves as community developers, and object to diverting project resources to academic research. Those from university backgrounds, who view themselves as professional development educators, have been interested in research questions as well.

What is the most efficient mix between expressive methods and concrete skill practice for non-formal education programs? How much skill practice do learners require at the various levels of organization of written language? Should materials bridge these levels one at a time, or should they deal with larger jumps in level? What degree of learner

initiative should materials demand? Will some types of learners learn
in a one stimulus - one correct response format, while others prefer more
active participation in learning? Will the preferred learning style vary
with the degree of familiarity with the skill being practiced? Will there
prove to be a difference in effectiveness between materials where chance
controls outcomes as compared to those where learner decisions predominate?
Will materials with visual stimuli perform differently than those with
oral stimuli? Finally, what costs would be associated with performing
the evaluation necessary to answer these questions?

The non-formal education project has, to date, resisted any temptation
to execute traditional rigorous evaluation of materials. It was reasoned
that, at this early stage in the field of materials development for non-
formal education, the prime concern was creating materials that would
physically reach rural non-school populations and emotionally attract
and motivate them to learn. Insofar as possible, decisions regarding
content were left in the hands of the client population. Measuring the
efficiency of learning was also an area of little concern to the project.

The project philosophy was that learners should decide for themselves
what contents were most relevant, what materials were most helpful. We
were content with very crude evaluation of materials. If a card game
became tattered, if people said they enjoyed it, and used it frequently,
the game was considered a success. When we went beyond this format into
experimental laboratory comparisons, we found that large investments of
time and energy, together with unsettling intrusions into village life,

produced data of questionable value.[1]

Rigorous evaluation could measure only concrete cognitive gains. The staff felt that immeasurable, affective and motivational outcomes were far more important. A game that succeeded in getting together isolated and alienated members of a rural community might show ABSOLUTELY NO COGNITIVE RESULTS, yet it might significantly change the lives of the individuals and the community.

An example regarding community reaction to literacy may serve to underscore the pitfalls of evaluation of cognitive gain. Several learning groups seemed to lose interest in literacy and to stop learning after group members had mastered a few basic words, and had learned how to sign their names. A professional evaluation-oriented literacy project might have interpreted declining fluency game scores as failure. Materials might have been revised, rewards devised for students who continued with literacy training.

Our project reacted first by offering other materials covering other content areas (to satisfy emerging motivation) and secondly by trying to find out why motivation had shifted. We concluded some rural Ecuadoreans may simply have different goals in literacy training than do literacy trainers. Signing one's own name, learning a few basic words seemed to have great meaning to people who may have considered literacy a magical skill invented by city people and denied rural dwellers by

---

[1]See Project Evaluation Report No. 1.

reason of their inferior intelligence. Once demystified, literacy seemed to have much less attraction. Once a peasant knows he <u>can</u> learn to read, he may no longer feel a need to learn to read. Moreover, there are no peasant-oriented reading materials available. Reading does not increase job opportunities. And peasants do not have a tradition of writing letters or books. If our project had been locked in to concrete cognitive learning objectives and formal evaluation, this valuable insight might never have come to light.

Strong resistance to the execution of evaluations in village settings comes from the community facilitators and the project field coordinators. These people do not see themselves as educational professionals. Their interest is community development, their commitment to their communities and not to the refinement and export of educational materials. They view as exploitative, any attempt by middle-class professionals to use village level reaction to materials in order to further knowledge about educational processes.

Secondly, use of evaluation results to make materials in given content areas more efficient and attractive might be seen by some project staff members to operate counter to the basic project philosophy of letting learners accept, modify or reject materials and methods. Solid evaluation results have proven so costly and time-consuming to obtain, that a large-scale evaluation effort would mean a significant shift in project priorities. If more energy went into EVALUATION, less energy would go into materials development and distribution. To some on the staff, this

would amount to the tail wagging the dog.

Those materials which can be evaluated are those which produce measurable cognitive outcomes. Such qualities as self-esteem, efficacy, conscientization are far less susceptible to measurement. Evaluation would initiate a tendency for emphasis to be placed upon those materials which had been evaluated, and which had proven effective. This would, in the judgement of field personnel, jeopardize the goals of the project.

There is one final argument against an evaluation that would lead to a curriculum or a structured, predetermined sequence of proven literacy materials. A slick sequence of materials which could make learning easy and effortless might actually operate counter to the goals of self-esteem, efficacy, and conscientization. Learners might come to see their achievements as a function of expert materials, and less as a product of their own initiative. Their dependence upon outside experts might grow, at the expense of their faith in their own ability to better their own situation. If there is one central message to non-formal education, in the opinion of this project, it is that educational and social change must be allowed to "bubble up" from the roots, rather than "trickling down" from centralized bureaucratic organizations.

The above arguments against traditional rigorous evaluation and revision of literacy-fluency materials are very real to the non-formal education project in Ecuador. The impulse to undertake such evaluation comes mainly from the American participants in the project: the USAID funding agency, and the University of Massachusetts professional educators. The

project has strived to conduct open and honest debate upon the proper role of Americans in the development of education in Ecuador. It is our belief that major decisions should be made by the Ecuadoreans on the staff. Therefore, some accomodation will have to be found between the legitimate desires of USAID to know that its money is yielding effective educational methods, the legitimate desire of UMass educational professionals to gain knowledge about the learning process in non-formal education, and the project's overriding commitment to the principle of Ecuadorean control over a project that influences the development of education in Ecuador.

APPENDIX

Name: El Chulo

Developed by: Edgar Jacome, Mauro Jacome

Objectives: to offer practice in:
1. encoding pictures representing animal names into written language
2. decoding written animal names into spoken words and pictures
3. to give an educational aspect to a traditional Ecuadorean betting game

Materials: Each face of three dice contains a picture of an animal. The game board consists of squares each of which contains the written name of an animal and the number of points for the animal. Each card contains only an animal name.

No. of participants: two or three players and a group leader

Process: The cards are shuffled and dealt to the players. Players choose three of their cards, and place them on the corresponding squares on the board. These represent their bets on which of the animals will emerge when the dice are thrown. Since some of the animals have (arbitrarily been given higher point values than others, they will tend to favor certain animals in their betting. The frog (rei pepino) is the most highly valued. When a player successfully bets on the grog, he automatically wins that game. Players keep a point total representing values of their correct bets.

Name: Concentration

Developed by: Pat Guild, and others

Objectives: To aid in memorization of different types of information
                     and associations necessary for the development of literacy.

Materials: Each set consists of up to 15 pairs of cards. A pair can
                     consist of identical letters, syllables, words, pictures,
                     or complementary pairs: a picture and the equivalent writ-
                     ten word, a first SYLLABLE and a last syllable of a two
                     syllable word.

No. of participants: from two to ten

Process: Cards are laid out face down in rows. The first player
                     turns up one card, and then a second one. He hopes for
                     a match. All the players try to remember the location
                     of the cards they have seen. The next player turns over
                     one card and then another. Whenever a player successfully
                     makes a pair, he takes the cards, and places them in front
                     of him. He also takes another turn. Play continues until
                     all cards have been matched. The winner is the person
                     with the most matched pairs.

Name: Lottery

Developed by: Eugenia Caceres

Objectives: This game was intented in order to develop the following
                         skills which are basic in reading and writing:

                         1. audiovisual association: object-spoken word-written
                              word
                         2. recognition of letters
                         3. recognition of words
                         4. familiarity with written words
                         5. internalization of written symbols
                         6. acquisition of vocabulary

Description: Players match word cards with the corresponding pictures
                         on their game boards.

Materials: Six game boards divided into twelve squares (4x3). On
                         each square is a drawing of an object: an animal, plant,
                         etc., 72 small cards, each one containing the name of one
                         of the objects represented on the large cards. The first
                         letter of each word is written in a different color from
                         the rest of the word, in order to place emphasis on the
                         specific letters of the alphabet. The attempt was made
                         to have each letter of the alphabet appear at the start
                         of at least one word.

No. of participants: From two to six, also one facilitator, who knows
                                  how to read.

Process: Each player receives a game board. The small cards with
                         the words written on them are placed in a bag, and the
                         facilitator begins drawing them out, one by one. He reads
                         the word (or simply shows it, encouraging the players to
                         read it). He delivers the card to the player who has the
                         drawing which corresponds to the word on the card. For
                         example, the word "burro" is given to the player who has
                         a picture of a "burro" on his card. The player places
                         the card on top of the squre with the picture of the
                         "burro." The first player who covers all of his pictures
                         is declared winner.

Options: What type of response is asked of the learner?

                         1. With beginning learners, the facilitator could read
                         out the card he drew, emphasizing the first letter. Play-
                         ers would repeat the word and then scan their cards, pro-
                         nouncing the words represented in their pictures, searching
                         for the picture corresponding to the word which had been
                         read aloud. The player who identifies the correct picture
                         is given the card by the facilitator.

                         2. With advanced learners, the facilitator could require
                         that the learners write the word on the blackboard, or even
                         write a phrase or statement using the word in order to re-
                         ceive the card with the word on it.

Comment: Unlike other fluency materials, this is an audio-visual game. In most learners, a tested picture should suggest the proper word in most learners' minds or inner ears. They then have only to translate this word to written form.

This task is quite different from that of the letter dice, where the learner must imagine and recreate the mental image of a word from letters and <u>then</u> express it in letters. As a result, this game may allow purer concentration on literacy as "a code."

Name: Labeling for Literacy

Developed by: Carla Clason

Objectives: To make written language part of village life.

Materials: Writing implements

Process: In a village where people are involved in literacy train-
                 ing classes, a campaign to label places and things could
                 take place. For instance, names could be written up for
                 areas in the village or surrounding it. Most of these
                 places already have names, therefore, a sign could be put
                 up with the written name of the place on it. A hilly
                 area might be called "El Cerrito del Carmen," someone
                 could then make a sign out of wood and paint that name
                 on it. Similar things could be done with names of roads
                 and with distances: "Camino a Panajachel, 5 kilometros;"
                 with names of rivers (streams) and bridges: "Rio Magdalena,
                 Puente Irun, etc." Signs could be placed in front of the
                 local store (if there is one), "Tienda Santa Rita." Inside
                 the store there could be an area designated for a list of
                 things one could buy with the prices. A blackboard could
                 be made by painting a small part of the wall with black
                 paint. If chalk can't be acquired, there are some types of
                 stones which mark, and often one can find pieces of chalk-
                 stone in the area or near the roads. (At least in Guatemala,
                 the government paints the kilometer signs with "cal," one
                 can find pieces of this along the road and one can write
                 with it!) People could also write messages on this board if
                 they wanted to.

                 Most villages have something which resembles a market day,
                 people get together on certain designated days and sell their
                 products. All it would take would be one person to come a-
                 long and label his or her merchandize: "arroz," "frijoles,"
                 "maiz," "cafe," etc. People would soon inquire what the
                 signs were for, what they said, and some might want to make
                 some of their own. This might not be so difficult, because
                 many Indian people know how to make dyes from various plants
                 and roots in order to dye the yarn with which they weave.
                 Some of this could be used as a type of ink. A stick could
                 be used to write with. If paper is available, that can be
                 used. But paper is often absent in rural areas; therefore,
                 pieces of wood could be used, or bark from trees. A black-
                 board could be constructed out of a large piece of flat wood
                 which could be painted black, and this could be placed in
                 the center of the market area. If one person started writing
                 a list of market prices, or products available, or announce-
                 ments or messages, a crowd would soon gather to see what was
                 happening there. This could be used for a lesson, because
                 curious people might want to know what the man was writing.
                 Soon this could develop into a reading lesson, and perhaps
                 people might try to immitate some of the letters too.

At the local church, a home-made blackboard could also be
put up for announcements and messages. The board in the
market place could also be used for information for farmers,
explaining in simple terms how to use fertilizer, informa-
tion about various seeds, etc. Health information could
also be written there.

Name: Letter Chips

Developed by: Carla Clason

Objectives: To offer practice in:

1. Recognizing and decoding letters and combinations of
    letters.
2. Assembling words from letters.
3. Encoding sounds into sequences of letters.

Materials: 66 letter chips, 1/2" x 1/2" containing the letters from
                   the letter dice. Several additional blank chips serve as
                   "wild cards," and can be used to represent any letter the
                   player chooses. Each chip also has a number written in
                   the lower left corner, which is used for scoring purposes.

No. of participants: from two to four

Process: Each participant chooses seven chips from the pile, with-
                   out looking at them. In order to decide who goes first,
                   each player reviews his letters for the one closest to
                   the front of the alphabet. If there is a tie between two
                   players, they present a second chip. The player closest
                   to the beginning of the alphabet begins play. Play will
                   rotate clockwise beginning with the first player.

                   The first player tries to form a word using as many of
                   the seven letters as he can. If he has successfully formed
                   a word, he lays out the word on the table in front of him
                   and draws the number of chips he has used, in order to once
                   again have seven chips.

                   The second player must try to build words from the existing
                   word (scrabble-style). He may lengthen the word or build
                   vertically from one of the word's letters. No new word may
                   follow a complete word, unless the player has a blank chip
                   to place between the old word and the one he is forming:

```
            D
            O
  C A S A □ C O M O
  A
  S
  O
```

                   If a player can successfully make an addition to an exist-
                   ing word to form another longer word, he may do so. If a
                   player can form no new words, he may try to replace letters
                   within an existing word to form a new word. He may do this
                   as long as his action does not upset other words in the
                   game.

Scoring: Each player keeps a tally of all the numbers on the chips he
           has successfully played. If he creates a new word by changing
           letters within or adding letters onto a pre-existing word, he
           receives full credit for the letters making up the new word.
           When a player forms a word of five letters or more, he auto-
           matically gets ten points added to his score.

Options: Vowels may be made one color and consonants another. Points
           which were originally assigned randomly, might be different
           values for consonants and vowels.

Name: Word Bingo

Developed by: Patricio Barriga, James Hoxeng

Objectives: To offer practice in recognizing and reading words.
                 To offer a non-threatening way for learners to practice
                 writing words.

Materials: Nine common words arranged in a different configuration
                 on each game board to form two diagonal lines. Below
                 each word is a blank space.

```

|        |          |             |         |       |       |
|        |        +-------+       |         |       |       |
|        |        | TODO  |       |         |       |       |
|        +--------+-------|       |         |       |       |
|        | CASA   |       | AQUI  |         |       |       |
|        |--------|       |-------|         |       |       |
| ALLA   |        |       |       |  CULPA  |               |
|--------|        |       |       |---------|               |
|        |        |       |       |         |               |
+-----------------------------------------------------------+
```

                 The group leader has a stack of cards containing the
                 same words.

No. of participants: from one to ten players and a group leader

Process: The facilitator chooses a card, and holds it up for
                 the learners to read. Learners read the word, and
                 search for the word on their boards. When they find
                 the word on their board, they will either mark the
                 corresponding blank with a bean or copy the word
                 with a pencil, depending upon their skill level.
                 The first player to complete a diagonal line wins.

Name: Letter Dice

Developed by: James Hoxeng, Amparo Borja

Objectives: To offer practice in 1. recognizing and decoding letters
                and combinations of letters, 2. assembling words from
                letters, and 3. encoding sounds into sequences of letters.

Materials: 11 wooden dice, approximately 1 1/2" on a side, each face
                of which contains a letter according to the following
                frequency distribution of letters in Ecuadorean Spanish:
No. of participants: from one to 20

Process: 1. "Finding a word:" Players search for words from the
                letters showing after the dice have been thrown. The
                first player to visualize a word declares the word, and
                tries to create it from the letters showing. After group
                confirmation of it's correctness, play resumes as players
                try to find other words. Play continues until the time
                limit is reached. The player who has formed the longest
                word is declared winner.

                2. "Building a word:" The first player places a letter
                from one of the faces of a dice in front of the group.
                The player to his right chooses another from the pile of
                dice, and places it next to the first letter. The object
                is to be the player who completes a word. When a word is
                completed, the next player tries to add letters to form a
                longer word. At any point in the game, one player may

challenge the player who has just added a letter. If the latter is not able demonstrated that he was building toward a legitimate word, he is out of the game.

Alternately, the game can be structured so that the player who completes a word has points scored against him. This is probably a more difficult version than the previous one. Both of these "building a word" versions are more difficult than the "find a word" version, since they require a more directed and active recall of specific words and their spelling.

3. "Word listing competition:" Players compete to form the largest possible number of words from one role of the dice in a given amount of time. People can compete as individuals or as teams. In either case, participants alternate between two roles; onlookers who recognize and monitor words formed by others, and active composers of words. This version is the one most popular in Ecuador to date.

Name: Letter Rummy

Developed by: Pat Guild

Objectives: To offer practice in:

1. Recognizing and decoding letters and combinations
    of letters.
2. Assembling words from letters.
3. Encoding sounds into sequences of letters.

Materials: The 66 letter rummy cards contain the letters on the
                faces of the 11 letter dice (see technical note no. 6).
                Players gain practice in reading, spelling, and forming
                words from combinations of letters.

No. of participants: 2 to 10

Process: 1. "Finding the words:" Deal out ten cards face up.
                Players take turns trying to form words from the letters
                showing. Each letter used successfully in a word is
                worth ten points. As words are formed, they are written
                down so that the letters can be used again to make new
                words.

                2. "Building a word:" Each player receives ten cards.
                The first player places a card face up, in front of the
                group. The second player adds a letter. The last person
                to place a letter completing a word receives one point
                for each letter in the word.* If, at any time, a player
                believes that it is impossible to form a word with the
                sequence of letters showing, he may challenge the last
                player to have added a letter. If the last player cannot
                identify a word which can be formed by adding more letters,
                the challenger receives a point for each letter showing.
                If, on the other hand, the challenged player can demon-
                strate such a word, he receives a point for each letter
                showing.

                3. "Letter Rummy:" Each player is dealt five cards.
                The other cards are placed face down in a pile. The first
                player to the left of the dealer draws a card from the
                deck and examines his store of letters to see if he can
                form a word. If he can, he places the cards face down in
                front of him, and then discards. If he cannot form a word,
                he simply discards. Play continues, until one player has
                gotten rid of all the cards in his hand. If the words he
                has formed are judged to be correct, he is the winner.
                Some variations in the game may be introduced by allowing
                players to pick up cards from the discard pile instead of
                drawing. Scoring can also be done according to the number
                of letters used in each word. Rarer letters could be ac-
                corded more points.

* Any time a player is unable to add a letter, he may pass.

Name:	Word Trip
Developed by:	John Hatch

Objectives: To offer practice in:

1. Recognizing and decoding letters and combinations of letters.
2. Differentiating consonants from vowels.
3. Assembling words from letters.
4. Encoding sounds with sequences of letters.

Description: This is a simple literacy game which combines board play and some strategy with word skills.

Materials: Board, a single dice, tokens for players, vowel cards, and consonant cards.

Process: Low player on dice throw goes first. Each player draws 5 vowels (cards). The first player rolls dice and advances according to the number rolled. Then the second player rolls and advances. A consonant card is drawn when a player lands on a "card" square. When the finish is reached, each player has 3 minutes to form as many words as possible with his letter cards. Each opponent then has 1 1/2 minutes to form new words with the same cards. Then the second player to finish has 3 minutes to form words with his cards and each opponent has 1 1/2 minutes to form new words from the same cards.

Scoring: 1 point is scored for each letter in a word. If a player forms a word with his cards before he reaches the finish, he scores 3 X the number of letters in the word, but the letters cannot be used again. Wrongly spelled words lose points equal to the number of letters. A <u>target</u> word decided upon at the start of the game may be used. A player who forms the target word scores 4 X the number of letters if the word is formed before finishing; 2 X the number of letters if formed after reaching the finish.

Operating Time: 20 minutes to 1 hour depending on the number of players.

START

Name: The Freire Game

Developed by: John Hatch

Objectives: To offer practice in:

1. Recognizing and decoding syllables and combinations
    of syllables.
2. Assembling words from syllables.
3. Encoding sounds into sequences of syllables.

Description: This game is based on the Freire approach, hence the title.
                 A word is chosen (i.e., Favela). It is broken down into
                 syllables with the vowel in each syllable changed to in-
                 clude all of the vowels:

                        Fa   Ve   La
                        Fe   Vi   Le
                        Fi   Vo   Li
                        Fo   Vu   Lo
                        Fu   Va   Lu

Materials: Each of the syllables is printed on a card. The total
                 cards needed for each word constitutes the deck. For
                 Favela, there is a 15-card deck. Another word is added
                 for each player and likewise broken down and made into a
                 deck, meaning a minimum of one deck per player is needed.

No. of participants: 1 to 10, or more.

Process: Each deck is shuffled and placed face upwards. In order,
                 the players draw one card then a second until all of the
                 cards are distributed equally to all of the players.
                 Then, within a given time period, each player must form
                 as many words as possible from the syllables which he has
                 drawn.

Scoring: May not be necessary. Could be based on the number of
                 words formed, length of words, or number of syllable cards
                 utilized in the words formed.

Options: 1. At the end of each round of drawing each player may
                     make a word. Players may build on others' words.
                 2. Players may use each others' words to make a phrase
                     or sentence.

Comment: This game is at the idea stage of development. It has
                 not been completed, played, or tested. Feedback is
                 needed.

Name: Jigsaw

Developed by: Carla Clason

Objectives: To demonstrate to the beginning learner, in a very non-
                    threatening way, 1. how syllables combine to form words,
                    2. how words combine into sentences which convey meaning.

Materials: The game consists of a jigsaw puzzle made up of 28 pieces.
                    Each piece contains a syllable and part of a pictorial
                    design.

No. of participants: open

Process: The puzzle is dissembled and the pieces are placed face
                    up on a flat surface. Players assemble the puzzle with
                    the assistance of three types of cues: the shape of the
                    interlocking puzzle pieces, the parts of the drawing with
                    its various colors, and the syllables on the pieces.

                    After the puzzle has been assembled, players must read
                    the written statement. In doing this, they have the aid
                    of the pictorial design, which makes the same statement
                    visually.

Name: The Sentence Game

Developed by: Jock Gunter

Objectives: To develop fluency in the formation of simple sentences from words, to gain an intuitive feel for grammar and syntax—for how different types of words play different roles in sentence building.

Description: By combining cards containing words and phrases, players assemble sentences and statements. Sentences become more complex as new types of cards are added.

Materials: The game consists of cards with words and phrases, which have been drawn from the players' vocabulary. The cards should at first fall into three categories: subjects, verbs, and objects. The play involves assembling different combinations of cards and reading the statements as they are created.

No. of participants: One or more players, who are already at home with letters and syllables, one facilitator with some knowledge of sentence structure.

Process: The simplest version of the game involves cards structured so that any sequence of a subject card, a verb card, and an object card will make sense. All cards fit a rigid sentence format. The three different types of cards are color coded, so that players just beginning to build sentences are assured of success. Any red card followed by a blue card followed by a yellow card makes a correct sentence.

At the start of the game, the cards are blank. The facilitator elicits words and phrases for the learners, which he writes on the appropriately colored cards. Each player is then dealt a number of cards from each category. One player leads off with a subject card, the next player follows with a verb card, and the third with an object card. Players read aloud and discuss the resulting sentence. Play rotates around the table.

Options: 1. Alternately, a solitaire version might appeal to certain learners. With one person building the sentences, the statements would be more his own creation than in the case of two or more players.

With categories color coded, there would be few mistakes. Positive reinforcement would be almost ensured. Would the players become bored? One must recall that this version is aimed at those learners who are just beginning to explore the expressive possibilities of written language. Each sentence is partially his own creation. Seeing meaning emerge from words, and reflecting upon that meaning may be sufficiently interesting to hold attention for quite some time.

2. One technique for maintaining interest would be humor.
Cards can be structured to produce humorous statements:

the stately queen	climbed	on top of the bus
the dog	drank	his <u>chicha</u>

When the subject creates an image which conflicts with
that of the verb or object, humor can result. Of course,
such humor must be created in the local communities in
order to be effective. One way of doing this would be to
leave some cards blank when play begins. Players would
be encouraged to fill them in as blank cards were dealt
them. Names of local personalities as subject or object
cards could lead to humorous sentences.

3. Other content areas could be built into the game in
order to maintain interest. In order to explore political
realities, half the cards could pertain to the lifestyle
of the rich and half to the poor.

Half could pertain to the city, half to the country. Cer-
tain statements which emerged would seem natural and true
to life. (The businessman sped through the village in his
car.) Others would seem highly unlikely. (The rich man's
son died of malnutrition.) In both cases, reflection and
discussion of political realities could result.

In a similar manner, nutrition could be used as content.
Statements which emerged during the game would be evalu-
ated as either good or bad nutrition habits. (The boy
ate 6 potatoes.)

4. For students at a higher level, the game could be com-
plicated in various ways. Removing color coding of card
categories would force the student to decide how a given
card would fit into a sentence. He would no longer be
able to mechanically sequence according to color. He
would take a more active role in the formation of the
sentence, based upon his growing understanding of sentence
structure.

5. To further complicate the game, the sentence format
could be loosened, expanded, or abandoned. Some verbs
would be transitive, some intransitive, some active, some
passive. Each of these verb types call for a different
type of object. The more the categories of card, the more
players one could involve. One player could be given all
the adverbs. This "adverb specialist" could add a word
wherever he thought it appropriate. It might be possible
to teach basic grammar and syntax without ever introducing
the technical al jargon.

Comment: The aim is to provide an in-between game, for learners who
are proficient in forming words from letters, but reluc-
tant to write Ashton-Warner style stories.

With the color coded game, there is no risk to the learner, since every attempt is a guaranteed ok sentence. As the game is complicated (removing color code, complicating sentence structure) the learner assumes increasing control over the statements he produces. They become less random and more his own creative expression. Thus, the learner can build toward self-expression in steps:

Subject———— intransitive verb ———— indirect object

Subject < transitive verb———— direct object
          intransitive verb ————indirect object

Subject < transitive verb———— direct object
          intransitive verb————indirect object

Modifiers

Adjectives   Participles   Adverbs   Adjectives
                             Participles   Participles

Are grammar and syntax helpful in building toward verbal expression? Can they be taught non-formally, by never mentioning the above technical terms? Testing the game might suggest answers to these questions.

Name: Rubber Stamp Literacy Method

Developed by: Jock Gunter, Dwight Allen

Objective: To try to build one flexible package which can:

1. offer instruction and practice on several levels:
    a. sound-letter associations
    b. syllable formation
    c. word formation
    d. phrase and sentence formation

2. interact with the self-expressive goals for rubber
    stamps.

Description: Rubber stamp vocabulary of letters and pictures.

Materials: 1. stamps with pictures--visual representations of key
words. Where possible, words should be generated at the
community level by Ashton-Warner style sessions. Pictures
must be tested to ensure that they evoke the words they
are meant to evoke.

2. stamps of all the letters and some commonly used
syllables.

No. of participants: From one to twenty players, and a facilitator with
elementary reading knowledge.

Process: <u>Teaching letter-sound associations</u>-- The facilitator takes
several picture stamps which represent words beginning with
a given letter or syllable (cama, casa, cabo), stamps them
and asks what they have in common. Students recite the
words, and perceive the similarity in sounds. The facilita-
tor can then introduce the written symbols "ca," and stamp
them next to all three picture stamps representing the
words cama, casa, and cabo. This can be left as a wall
display, so that learners can reinforce this association
in their minds. A vocabulary of basic syllables and letters
can be introduced in this way.

<u>Reinforcing letter-sound associations</u>-- Once the group has
learned a few letters and syllables, the learners can be
divided into pairs, and work with the letter and picture
stamps corresponding to the vocabulary already introduced.
One learner stamps a picture, the other must stamp the
correct beginning syllable of the word represented.

<u>Teaching written words</u>-- The facilitator produced two pic-
ture stamps, whose first syllables are known. Students
are then induced to transfer these syllables to another
complete word:

CASA   MANO

CAMA
<u>Reinforcing written words</u>-- Students could divide into
pairs or teams, each with a pile of picture and letter
stamps (which had already been taught). One student
stamps a picture, the other must respond by building
that word from letters.

<u>Teaching written statements</u>-- A combination of picture
stamps are strung together. Corresponding words are
built from the letter stamps, directly below the picture
story. By showing how different picture statements trans-
late into different types of word statements, the facili-
tator can help the students begin to see different types
of sentences.

<u>Reinforcing written statements</u>-- One student makes a
picture puzzle, which his partner must unravel and express
in words.

Comment: Once the above sequence of steps has been taken, students
may be well on their way to visualizing stories, fotonovel-
as, and radio scripts. It would be fascinating to see if
visual symbols, stored spoken vocabulary, and letter symbols,
might interact to propel the learner more rapidly toward
self-expression goals. Working in three media of thoughts
(visual-oral-written), two of which are known, and non-
threatening, may speed up acquisition of fluency and con-
fidence in the third medium--the written language.

At all steps, learners should be encouraged to display what
they have created. Letter and syllable associations to
picture symbols, words, and picture-word statements, would
be of value as displays. Learners could reinforce what
they have learned, and potential learners could be attracted
by the displayed materials.

If the notion of display of exercises caught on, it might also spark the desire for creation and display of self-expressive projects. Folk sayings, community journals, village histories, all could be invented by advanced learners and portrayed in both pictures and words simultaneously. To a degree, each display could be a puzzle and learning opportunity for learners at all levels, much in the way that sub-titles on a foreign film can help you understand a language you are only vaguely familiar with.

How to physically display materials? Newsprint, taped on the wall would be one solution. Stamping directly onto white walls on the inside and outside of buildings (which could be painted over periodically) might catch on in some communities. Carla Clason has also suggested use of indigenous materials for washable dices, which could be put in stamp pads.
