Abstract

X-ray interaction data useful in X-ray fluorescence analysis of geological samples were compiled on a Univac 1110 computer by means of a Fortran IV program. Based on fit coefficients the tabulations include values for the photoelectric absorption coefficient, the coherent and incoherent scattering coefficients, the ratio of the total scattering coefficient to the total X-ray attenuation coefficient, the ratio of the coherent to the incoherent scattering coefficient, and the half-range of characteristic Kα X-rays for 14 oxides, international geochemical reference samples, selected minerals, and selected fluxing agents. A graphical representation of some of these data is also included. For the geological samples are also tabulated X-ray interaction data for the radiation of 9 radioisotopes commonly used in energy-dispersive X-ray fluorescence analysis.

Contents

1. Introduction

Accurate and easily accessible X-ray attenuation coefficients are great-
needed for X-ray intensity corrections in X-ray fluorescence analysis.
is not within the scope of this paper to discuss these correction methods
detail because a great variety of papers describing physical phenomena
volved with the production and measurement of secondary X-rays (e. g.
n Hamos 1945, Klug et al. 1948, Sherman 1958) and papers presenting
-ray intensity correction methods can be found in the literature. In short,
wever, correction methods are based on three assumptions:

The investigated sample is infinitely thick for the primary radiation
(source).

Attenuation of primary radiation and generated characteristic X-rays
is exclusively determined by the photoelectric effect, i. e. scattering
contributions are negligible.

The analysed sample is homogeneous.

With these considerations, X-ray intensity corrections given in the
rature are more or less based on the simple formula for the intensity
secondary X-rays

$$I_s(N) = K \cdot \frac{w(N)}{w(N) + a_Z(N) \cdot w(i)} , \tag{1}$$

re w(N) is the weight fraction of element N in the sample, w(i) are the
ght fractions of all other elements in the sample not to be analysed for,
N) is the characteristic X-ray intensity of element N, K is a constant
ending on instrumental conditions, the primary X-ray intencity and the
ment under investigation, and $a_Z(N)$ is an X-ray absorption parameter,
ned by Beattie and Brissey (1954), characterizing the influence of the
ment with atomic number Z upon $I_s(N)$. $a_Z(N)$ is exclusively a function
he total X-ray attenuation coefficients for both the primary and the
ted radiation and of the geometry of the analytical system. If the en-
ement effect is negligible, this parameter can be expressed as

$$a_Z(N) = \frac{\mu_p(i) + G \cdot \mu_s(i)}{\mu_p(N) + G \cdot \mu_s(N)} , \tag{2}$$

where $\mu_p(i)$ and $\mu_s(i)$ are the total X-ray attenuation coefficients for the primary and the secondary radiation of element i respectively, $\mu_p(N)$ and $\mu_s(N)$ the respective values of element N, and $G = \sin\Theta/\sin\phi$, where Θ is the angle between sample and incident primary radiation and ϕ the emerging angle of the secondary radiation. Introducing

$$a_M(N) \cdot w(M) = \sum_{i=1}^{N-1} a_i(N) \cdot w(i), \qquad (3)$$

where M is an index ascribed to the matrix, (1) can be rewritten in the form of

$$I_s(N) = K \frac{w(N)}{w(N) + a_M(N)(1 - w(N))}. \qquad (4)$$

which is the one commonly used in X-ray fluorescence analysis. The equation is difficult to solve because only $I_s(N)$ is determined experimentally. Without going into a detailed discussion of various methods applied to solve (4), four cases of approximate problem solutions can be mentioned:

1) Methods involving external standards,

2) Methods in which chemical compounds in known quantities are added to, mixed with, or diluted in the sample,

3) Mathematical methods for solving of (1), and

4) Use of scattered radiation.

The methods of external standards are widely used in X-ray fluorescence analysis. These methods assume that the X-ray attenuation parameters of the standards are equal to $a_M(N)$. In this case by measurement of the X-ray intensities of both the standards and the sample under identical physical conditions, (4) can be solved graphically or algebraically.

In addition-mixing-dilution methods measurement of both the sample and one or two samples where the original sample composition is changed by addition, mixing or dilution of known chemical compounds, is carried out. It is then possible to eliminate two unknowns in (4) and determine w(N) (e. g. Sherman 1958, Tertian 1968, Gwozdz 1974).

Methods employing mathematical corrections make use of theoretical or experimental evaluation of the $a_i(N)$ incorporated in $a_M(N)$ according to (3). After transformations in (4) a system of linear equations can be

established and a solution vector in the form of unknown concentrations in the sample can be computed (Beattie and Brissey 1954, Lucas-Tooth and Pyne 1964, Holland and Brindle 1966, Kodama et al. 1967).

Additional information for solving of (4) is obtained by analysing the scattered radiation also recorded by an X-ray fluorescence apparatus. The ratio of fluorescent to scattered or of incoherently to coherently scattered X-rays gives information about the matrix of the sample (Andermann and Kemp 1958, Reynolds 1963, Champion et al. 1966, Kunzendorf 1972).

Tabulations of X-ray attenuation coefficients exist for most elements of the Periodic Table (Victoreen 1949, Leroux 1962, Heinrich 1966, Theisen and Vollath 1967, Champion et al. 1968, Mc Master et al. 1969). Outside the absorption edges agreement of the published values is normally within $\pm$ 5%, but worse inside the L-, M- and N-absorption edges. Table 1 illustrates this with comparison of data given by Heinrich (1966), Theisen and Vollath (1967), and McMaster et al. (1969) for forty elements. The following definitions were used in this table:

$$DEV 1 = \sum_{Z=3}^{42} \frac{\mu_{Z, \text{TH or H}} - \mu_{Z, \text{McM}}}{\mu_{Z, \text{McM}}} \times 100/40 ,$$

$$DEV 2 = \sum_{Z=3}^{42} \left| \frac{\mu_{Z, \text{TH or H}} - \mu_{Z, \text{McM}}}{\mu_{Z, \text{McM}}} \right| \times 100/40$$

where $\mu_{Z, \text{TH or H}}$ are the given total attenuation coefficients for the characteristic average $K\alpha$ X-ray energy of element Z presented by Theisen and Vollath, and Heinrich respectively, and $\mu_{Z, \text{McM}}$ is the value presented in this report. Under the heading Maximum Deviations four extreme DEV 2 values are given for each characteristic $K\alpha$ X-ray energy.

In some of the published tabulations X-ray attenuation coefficients are given up to 15.7 keV, the $K\alpha$ X-ray energy of Mo $K\alpha$ X-rays partly for experimental reasons. Since the introduction of energy-dispersive X-ray fluorescence (EDX-) analysis incorporating semiconductor detectors, the high-energy region of X-rays has become of more interest. Sufficient excitation of $K\alpha$ X-rays of heavy elements is achieved in this case by both low-power X-ray tubes and radioisotopic sources.

The first compilation of total attenuation, coherent scattering, and incoherent scattering cross sections has been given for a variety of X-ray energies for all elements of the Periodic Table by McMaster et al. (1969). These data are also stored on magnetic tape in barns/atom and include

values for the energies just before and just after the K absorption edge. For other X-ray energies than those compiled linear interpolation between the given values is recommended by the authors. In X-ray fluorescence analysis of geological samples total X-ray attenuation coefficients in cm^2/g for the characteristic X-rays of all elements of the Periodic Table, in particular geological compounds (e.g. rocks), are required rather than cross sections in the form mentioned before.

We calculated X-ray attenuation data in the form especially suitable for the user in the field of geoscience. In this report we present therefore photoelectric absorption, coherent scattering, and incoherent scattering coefficients for X-rays based on the work of Mc Master et al. (1969) in the form of tables for:

1) 14 oxides,

2) international geochemical reference samples,

3) 9 selected minerals and 3 selected fluxing agents,

for the characteristic K X-rays of the elements Na through U. These data are given in cm^2/g. The tables include also the ratios of total scattering (incoherent + coherent scattering) to total attenuation, the half-range of characteristic X-rays in the sample materials, and the ratio of coherent to incoherent scattering. For the US Geological Survey standard rocks, H_2O, SiO_2, $Li_2B_4O_7$, $Na_2B_4O_7$, and Norrish flux these data are also given in the form of plots. Under a special heading we tabulated X-ray interaction data for the radiation emitted by 9 radioisotopes which are primarily applied in EDX-analysis.

To compute all the data a Fortran IV program was used together with a Univac 1110 computer. With the computer program used the same kind of data for any other geological sample may be calculated.

2. Method of Compilation and Tabulation

In the following tables with the compiled X-ray interaction data the succession of the data is:

1) the element symbol,

2) the average Kα X-ray energy (K-ALFA(1+2)) for the elements Na through Sn or the $K\alpha_1$ X-ray energy (K-ALFA(1)) for the elements Sb through U,

3) the photoelectric absorption coefficient,

4) **the coherent scattering coefficient,**

5) **the incoherent scattering coefficient,**

6) **the half-range of X-rays of given energy in the sample,**

7) **the ratio of the total scattering to total X-ray attenuation, and**

8) **the ratio of the coherent scattering to the incoherent scattering coefficient.**

The most prominent contribution to the attenuation of X-rays in the low-energy range comes from the photoelectric effect. The _photoelectric absorption coefficients_ $\mathcal{T}(Z)$ for elements with atomic number Z were compiled by means of the expression

$$\mathcal{T}(Z) = \exp\left\{ \sum_{i=1}^{3} A_{F,i}(Z)(\ln E_i)^i - \ln C \right\} / r_J , \tag{5}$$

where $A_{F,i}(Z)$ is the fit coefficient for element Z given by McMaster et al. (1969), E_i the energy of the characteristic X-rays in keV, C a constant for the conversion of data given in barns/atom into cm^2/g, and r_J are the absorption-edge jump-values.

Similar to expression (1) the _coherent scattering_ coefficient $\sigma_{coh}(Z)$ is calculated from

$$\sigma_{coh}(Z) = \exp\left\{ \sum_{i=0}^{1} A_{coh,i}(Z)(\ln E_i)^i - \ln C \right\} , \tag{6}$$

while the _incoherent scattering_ X-ray mass absorption coefficient is calculated using the formula

$$\sigma_{incoh}(Z) = \exp\left\{ \sum_{i=0}^{1} A_{incoh,i}(Z)(\ln E_i)^i - \ln C \right\} . \tag{7}$$

The _total X-ray attenuation_ coefficient $\mu(Z)$ is not tabulated, but may be calculated from

$$\mu(Z) = \mathcal{T}(Z) + \sigma_{coh}(Z) + \sigma_{incoh}(Z) . \tag{8}$$

The _half-range_ is calculated using the following expression

$$R_{1/2} \,(mg/cm^2) = \frac{693.15}{\mu(Z)} . \tag{9}$$

From these values an approximation for the thickness of an infinitely thick sample can be obtained by the simple formula

$$R_{inf}(mg/cm^2) \approx 7 \cdot R_{1/2} \cdot \sin\theta, \tag{10}$$

where θ is the angle under which the radiation penetrates the sample.

The <u>ratio of the scattering to the total</u> X-ray attenuation coefficient was calculated using the formula

$$R_1 = \frac{\sigma_{coh}(Z) + \sigma_{incoh}(Z)}{\mu(Z)} \times 100 \; (\%), \tag{11}$$

whereas <u>the ratio of coherent to incoherent</u> scattering was calculated from

$$R_2 = \frac{\sigma_{coh}(Z)}{\sigma_{incoh}(Z)}. \tag{12}$$

The X-ray energy values used were taken from Bearden and Burr (1967), whereas energy data on radioisotopes used in our tabulations are based on the work of Lederer et al. (1967).

<u>X-Ray Interaction Data of Selected Oxides</u>

X-ray interaction data for 14 oxides are given in the following. The tabulations include data on the major oxides SiO_2, Al_2O_3, Fe_2O_3, FeO, MgO, CaO, Na_2O, K_2O, H_2O, TiO_2, P_2O_5, and MnO, which are the most commonly reported components in quantitative analysis of geological samples. Data are given for the average $K\alpha$ X-ray energies for the elements Na through Sn and for the characteristic $K\alpha_1$ X-ray energies for the elements Sb through U. For SiO_2 and H_2O a plot of interaction data vs. X-ray energy is also given. In addition to data for the major oxides X-ray interaction data for ZrO_2 and Cr_2O_3 are given for the same X-ray energies. Table 2 is a guide to the tabulations of X-ray interaction data of oxides.

<u>Table 2</u>

X-Ray Interaction Data of International Geochemical Reference Samples

Chemical analyses of international geochemical reference rock and mineral samples have been compiled by Flanagan (1972). The contents of the major oxides in these rocks are given in table 3. The tabulations of X-ray interaction data for these samples are based on these analyses. They include data for 8 US Geological Survey (USGS) rock standards and 11 other internationally known standards for the average Kα X-ray energies for the elements Na through Sn and for the characteristic $K\alpha_1$ X-ray energies of elements Sb through U. X-ray interaction data for the remaining 10 rock standards, also reported by Flanagan (1972), can be evaluated from the given data according to the guidance table, table 4. X-ray interaction data in the form of plots are given for the USGS samples.

X-Ray Interaction Data for Selected Minerals and Selected Fluxing Agents

X-ray interaction data for selected minerals and selected fluxing agents for the same X-ray energies as for rocks and oxides are given in the following. The guiding data can be found in table 5.

X-Ray Interaction Data for Selected Radioisotopes

In EDX-systems both X-ray tube excitation and excitation by means of radioisotopes are used. Frequently used radioisotopic sources include encapsulated radioisotopes and radioisotope-target configurations. For X-ray interaction data for radioisotope-target sources the tabulations given under the headings oxides, international geochemical reference samples, and minerals may be used. For example, for the radioisotope-target configuration ^{241}Am/Mo interaction data for Mo are valid. In our tabulations X-ray interaction data for the radioisotopes ^{55}Fe, ^{238}Pu, ^{109}Cd, ^{241}Am, ^{125}I, ^{210}Pb, ^{130}Tm, ^{153}Gd, and ^{57}Co are presented. Some pertinent data on these radioisotopes are given in table 6. Contrary to the previous tabulations for oxides, rocks, minerals, and fluxing agents the first column of our tables contains the kind of the radiation emitted (e.g. Np L X-rays) and the second column the energy used under the heading of each radioisotope. A guide to the tabulated X-ray interaction data of radioisotopic sources for selected oxides, rocks, minerals, and fluxing agents is given in table 7.

Table 6

**Half-life, source strength used, and range of application
of selected radioisotopes**

Radioisotope	Half-life (years)	Recommended source strength* (mCi)	Range of application for K X-ray excitation
^{55}Fe	2.7	⟩ 5	P - Cr
^{238}Pu	86	30	K - As
^{109}Cd	1.3	⟩ 3	Rb - Mo
^{241}Am	458	30	Rb - Tm
^{57}Co	.74	⟩ 3	Hf - Pb, U, Th
^{125}I	.16	25	Rb - Sn
^{210}Pb	22	19	Rb - Gd
^{170}Tm	.35	⟩ 3	Rb - Dy
^{153}Gd	.66	10	Hf - Pb, U, Th

* estimates for small-area semiconductor detectors

Fig. 1. X-ray interaction data for andesite (USGS-AGV-1) and basalt (USGS-BCR-1) plotted vs. X-ray energy. Curve 1 is the photoelectric absorption coefficient τ, 2 the coherent scattering coefficient σ_{coh}, 3 the incoherent scattering coefficient σ_{incoh}, 4 the half-range $R_{1/2}$, 5 the ratio of scattering to total attenuation coefficient, and 6 the ratio of coherent to incoherent scattering. The dimensions of the ordinates of the different plots are given on the left-hand side of the figure.
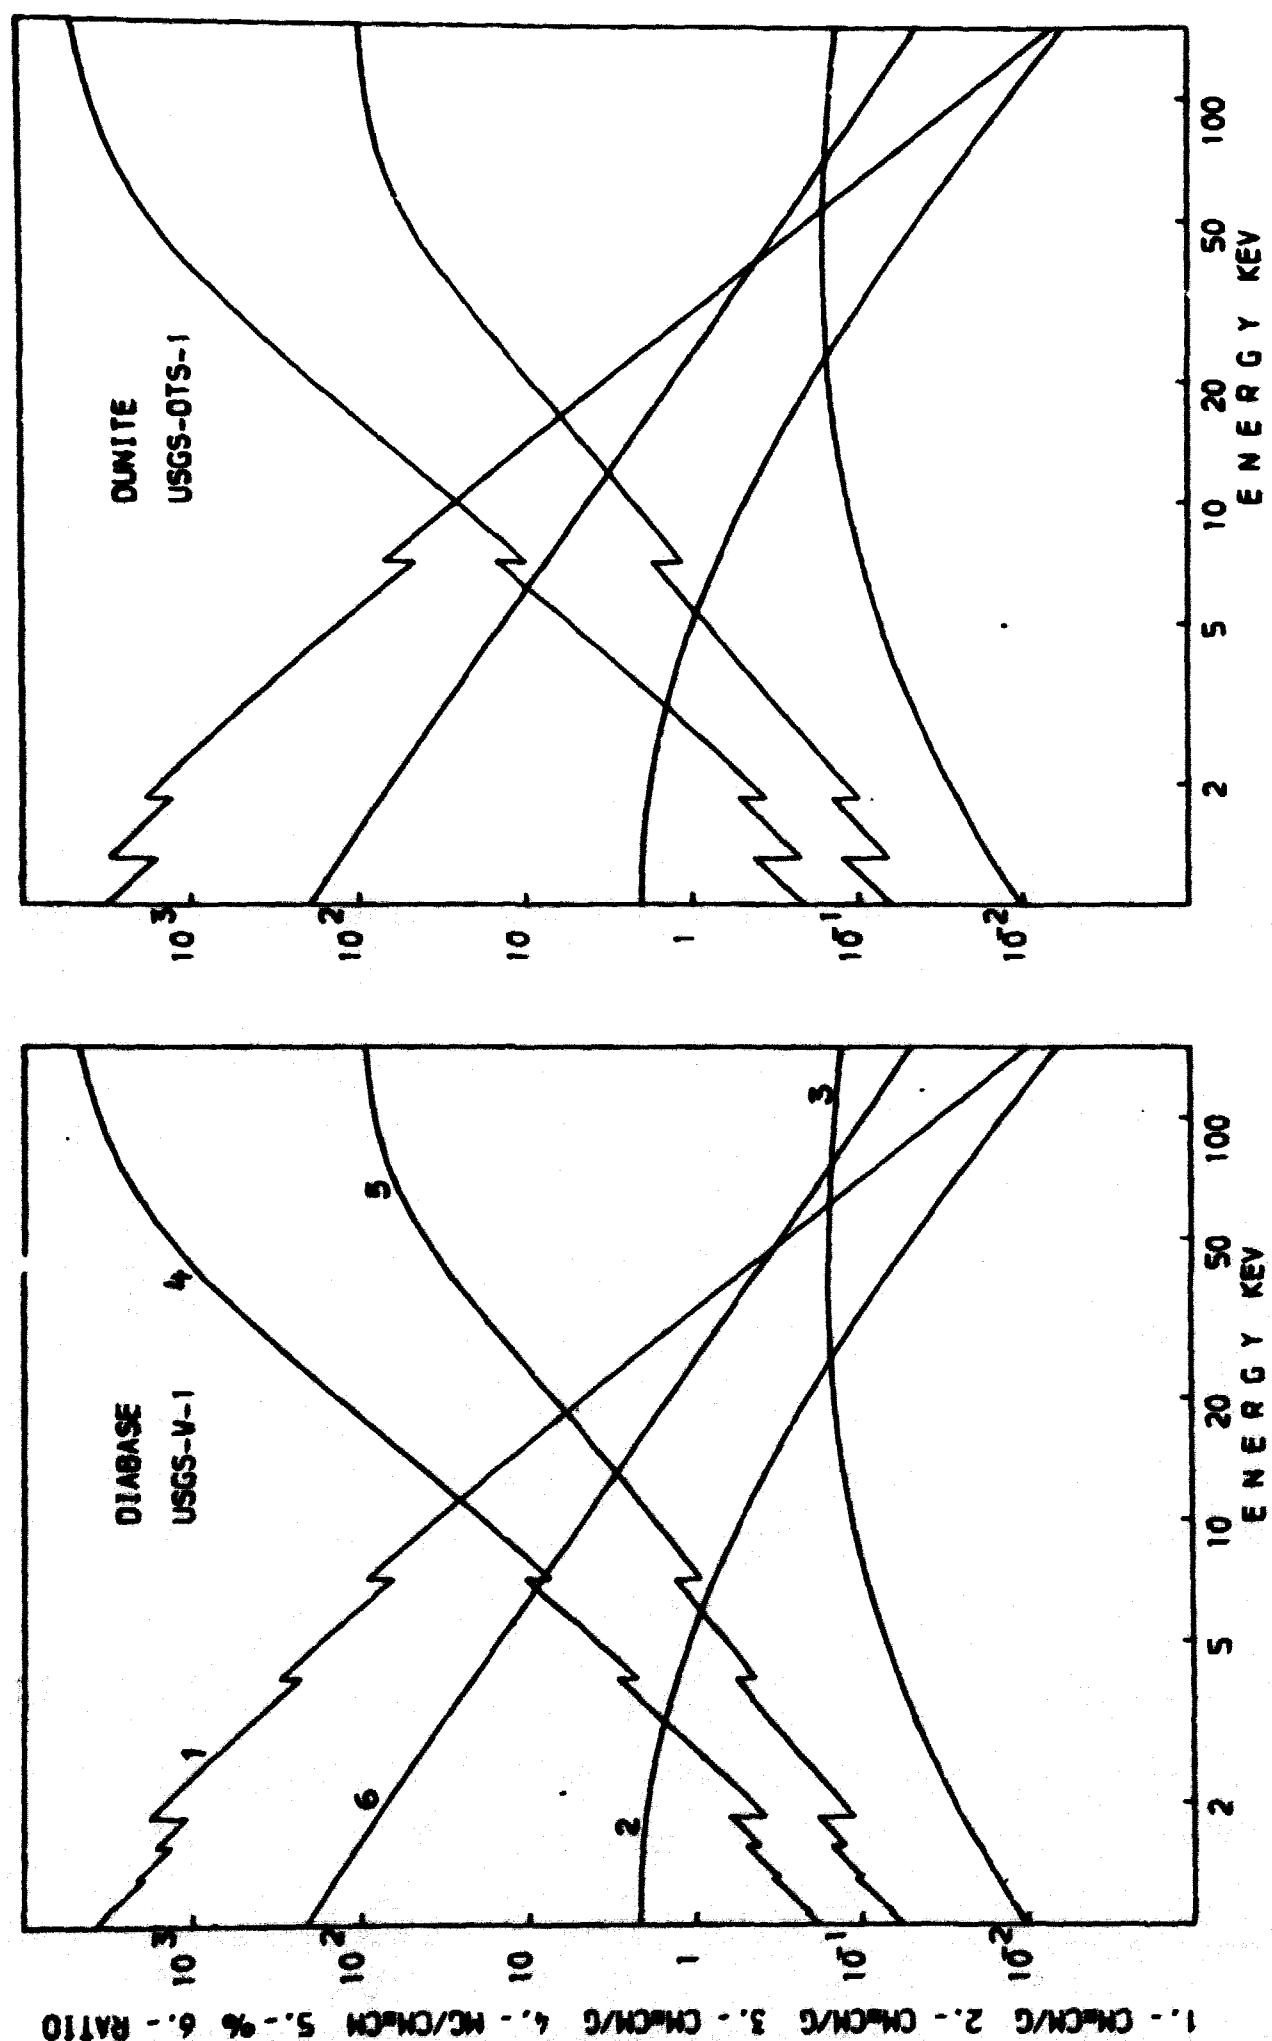

Fig. 2. X-ray interaction data for diabase (USGS-W-1) and dunite (USGS-DTS-1) plotted vs. X-ray energy. For explanations of numbers and dimensions see fig. 1.
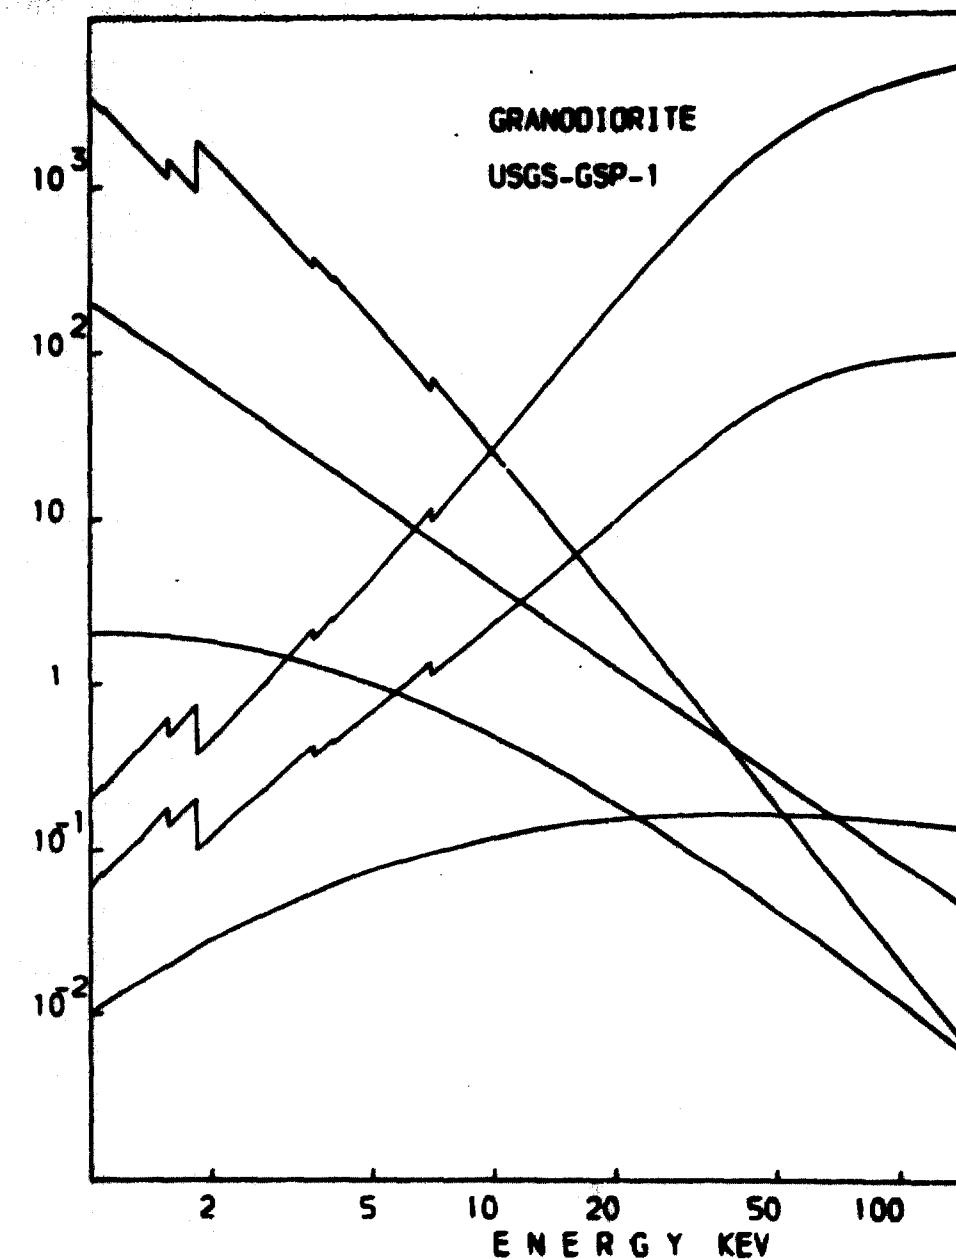

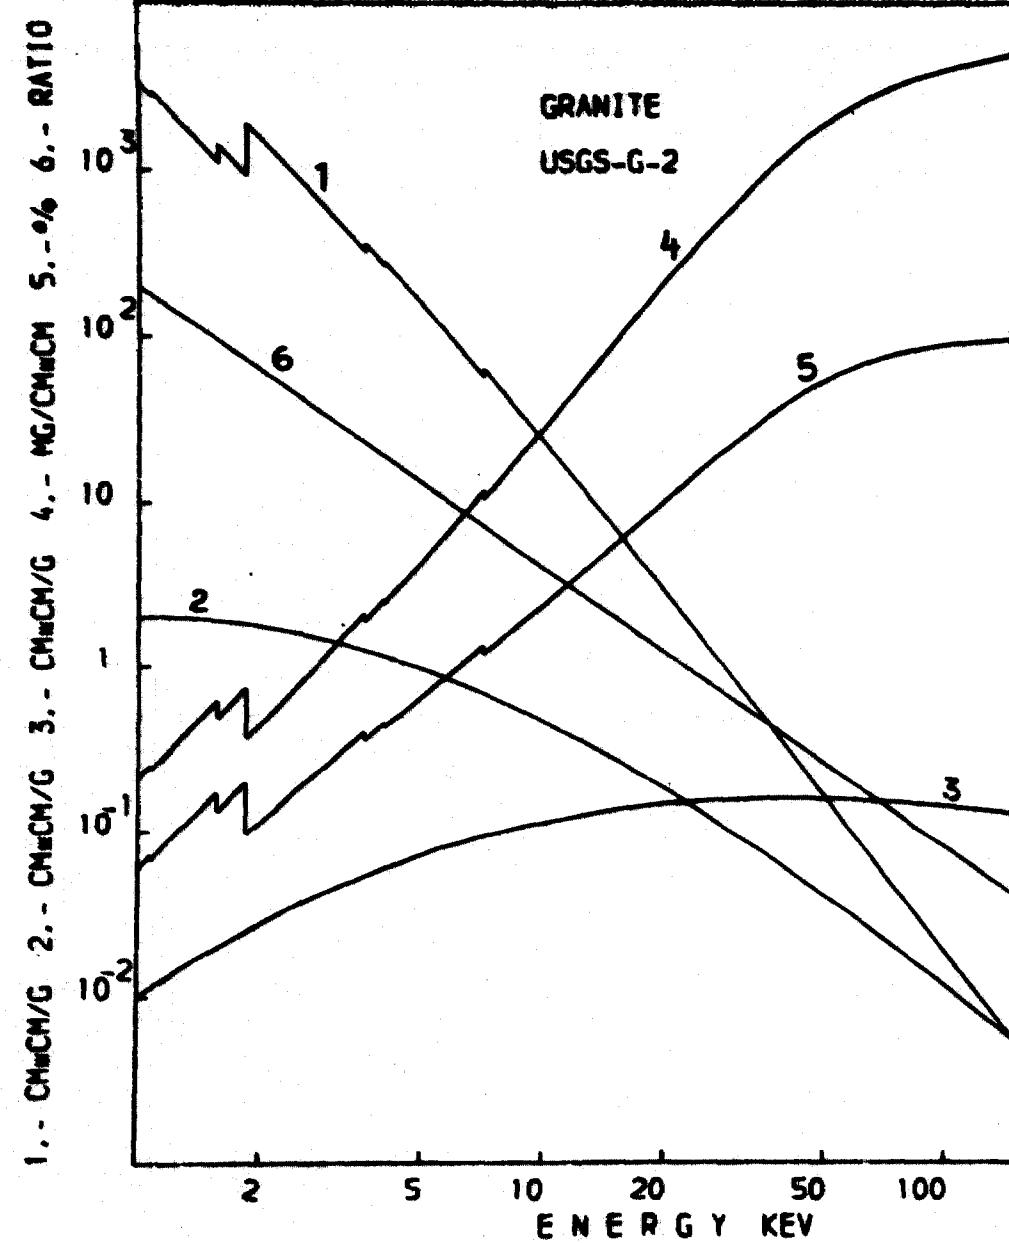

Fig. 3. X-ray interaction data for granite (USGS-G-2) and granodiorite
(USGS-GSP-1) plotted vs. X-ray energy. For explanations of numbers
and dimensions see fig. 1.
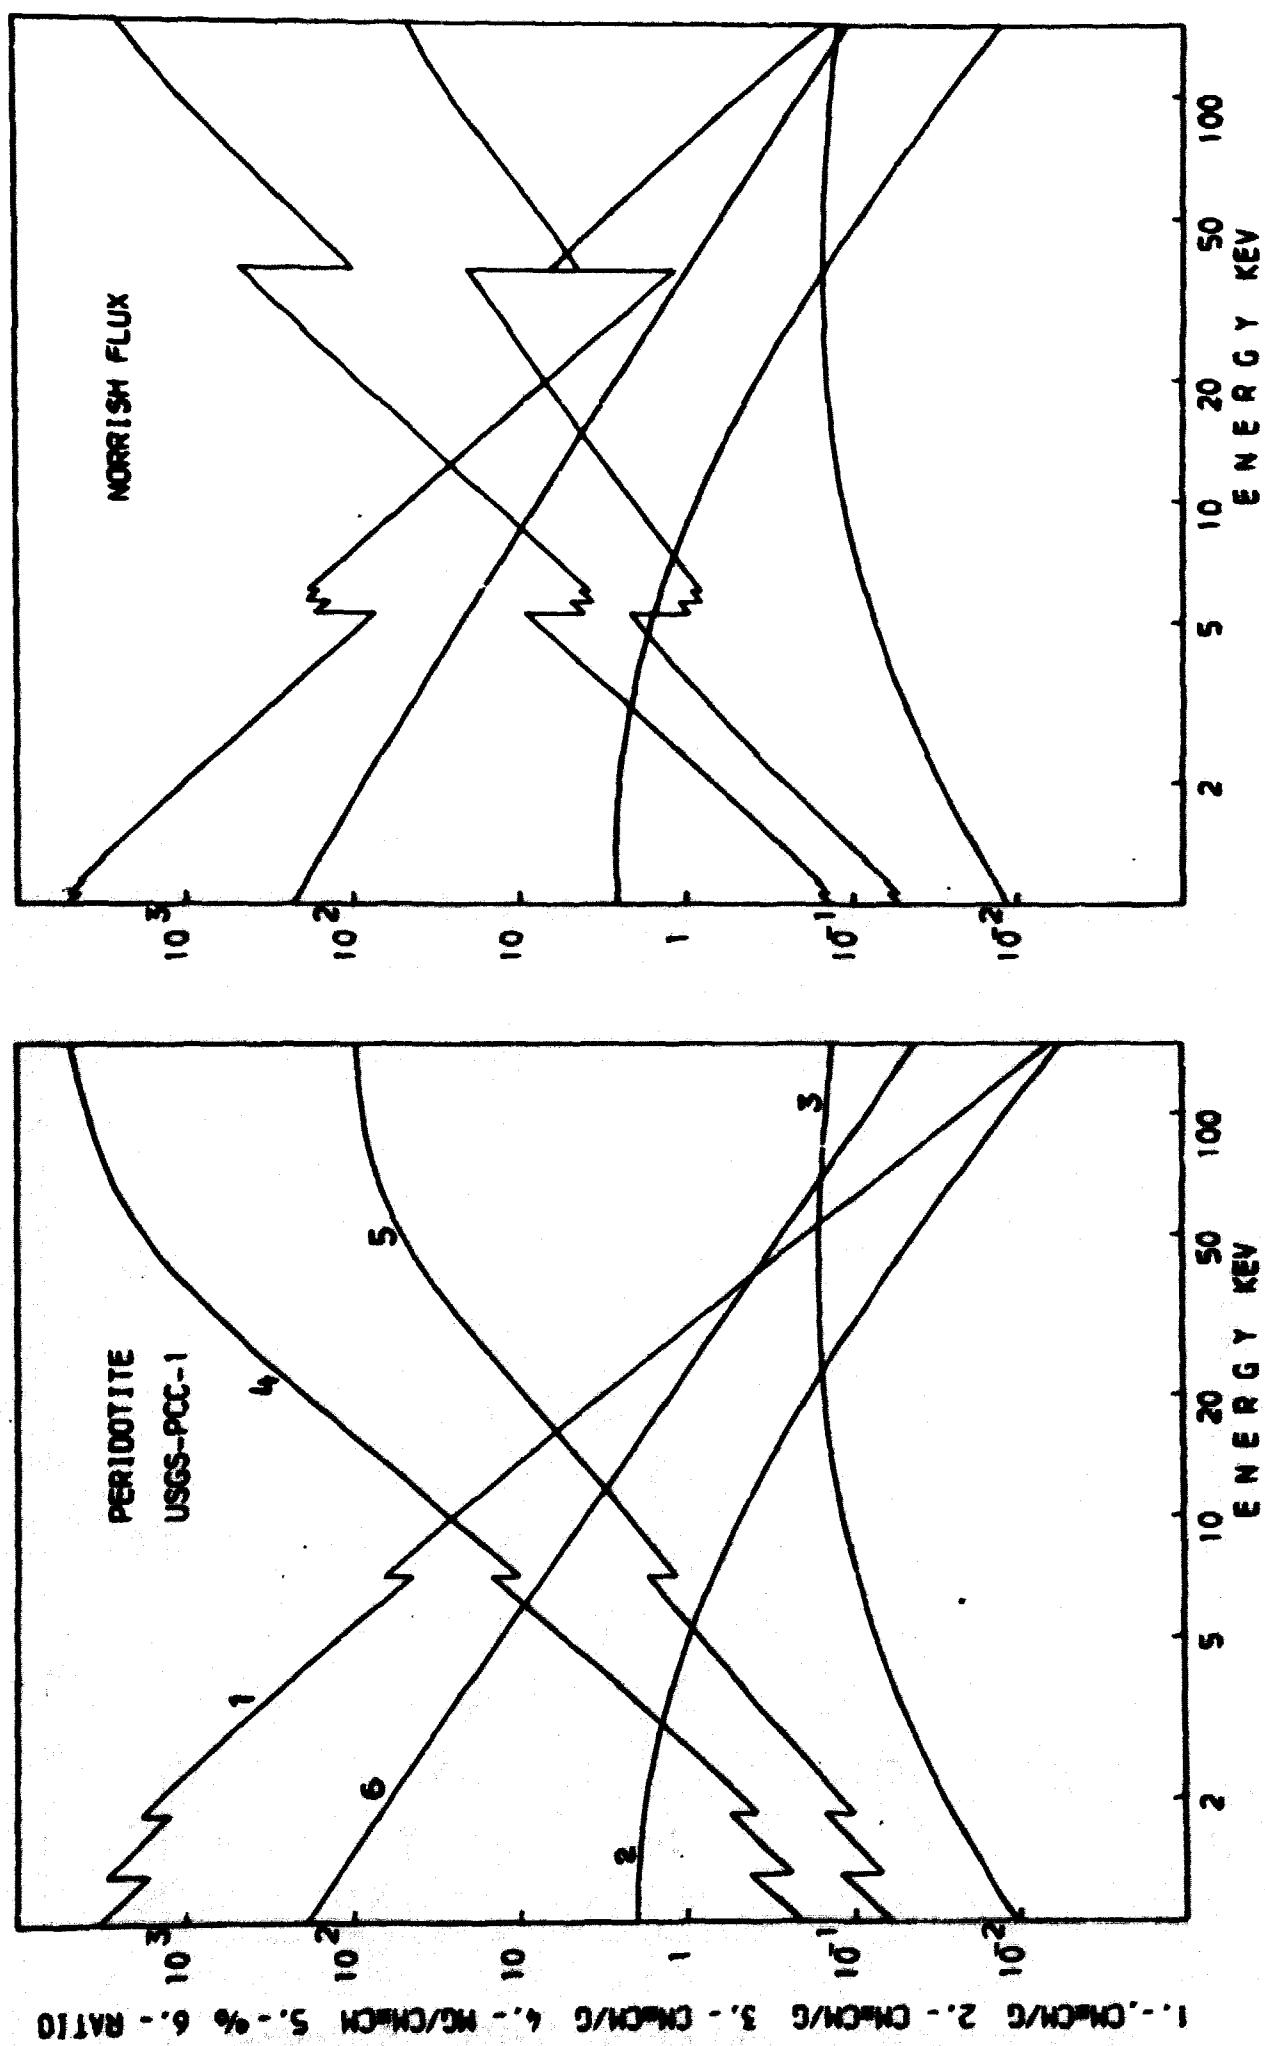

Fig. 4. X-ray interaction data for peridotite (USGS-PCC-1) and Norrish flux plotted vs. X-ray energy. For explanations of numbers and dimensions see fig. 1.
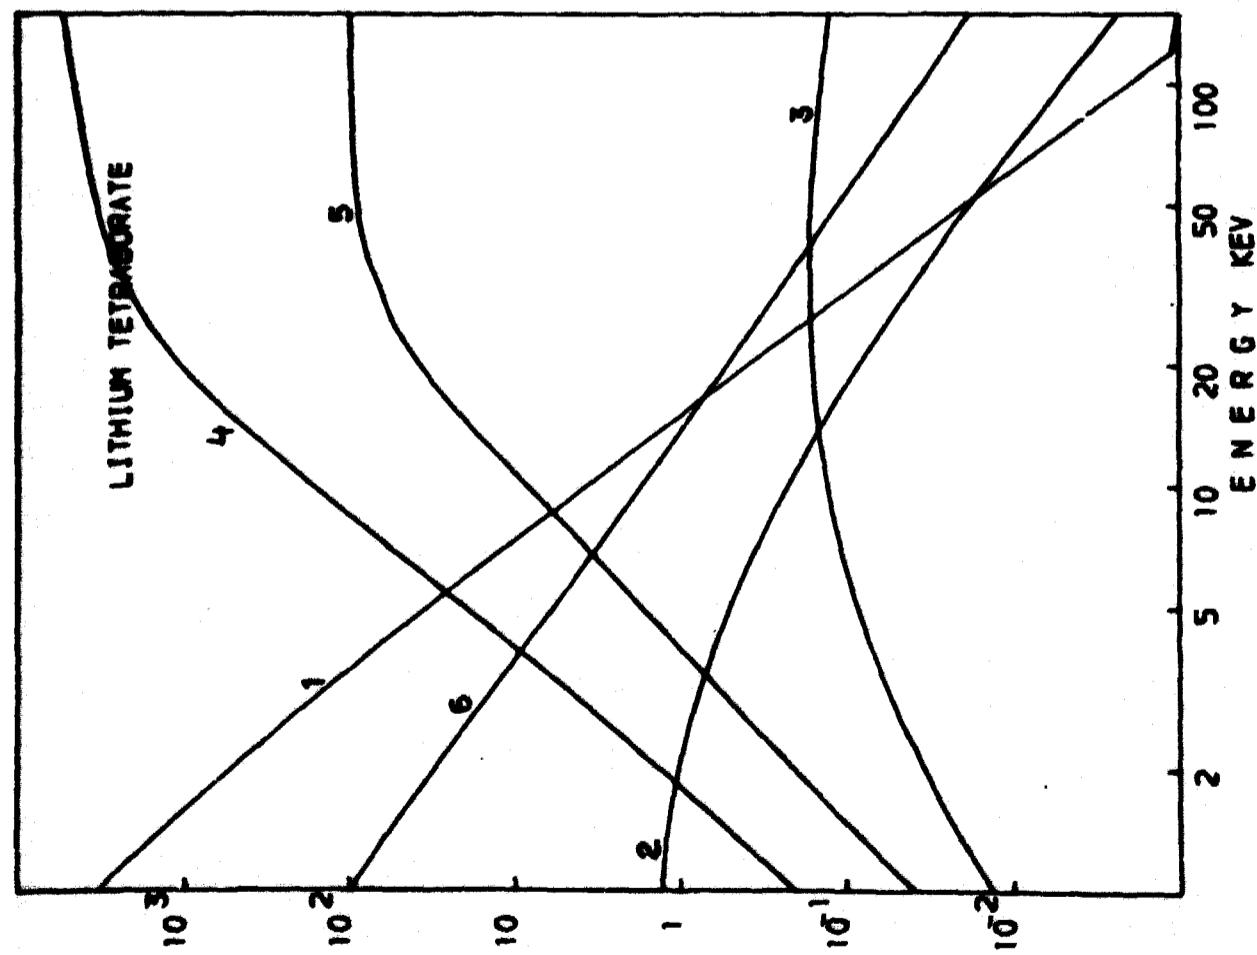

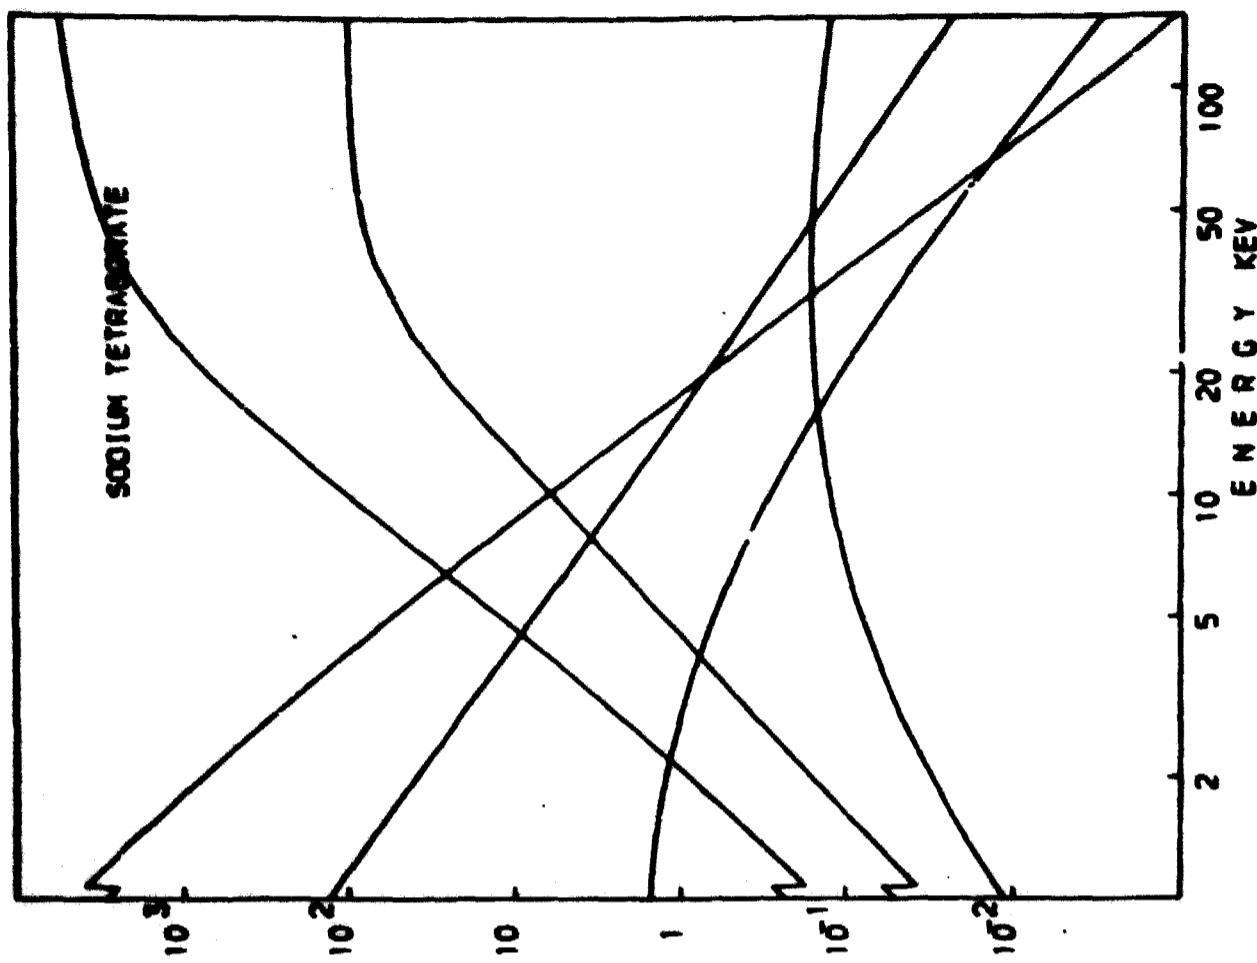

Fig. 5. X-ray interaction data for $Li_2B_4O_7$ and $Na_2B_4O_7$ plotted vs. X-ray energy. For explanations of numbers and dimensions see fig. 1.

1.- CM.CM/G   2.- CM.CM/G   3.- CM.CM/G   4.- MG/CM.CM   5.- % 6.- RATIO
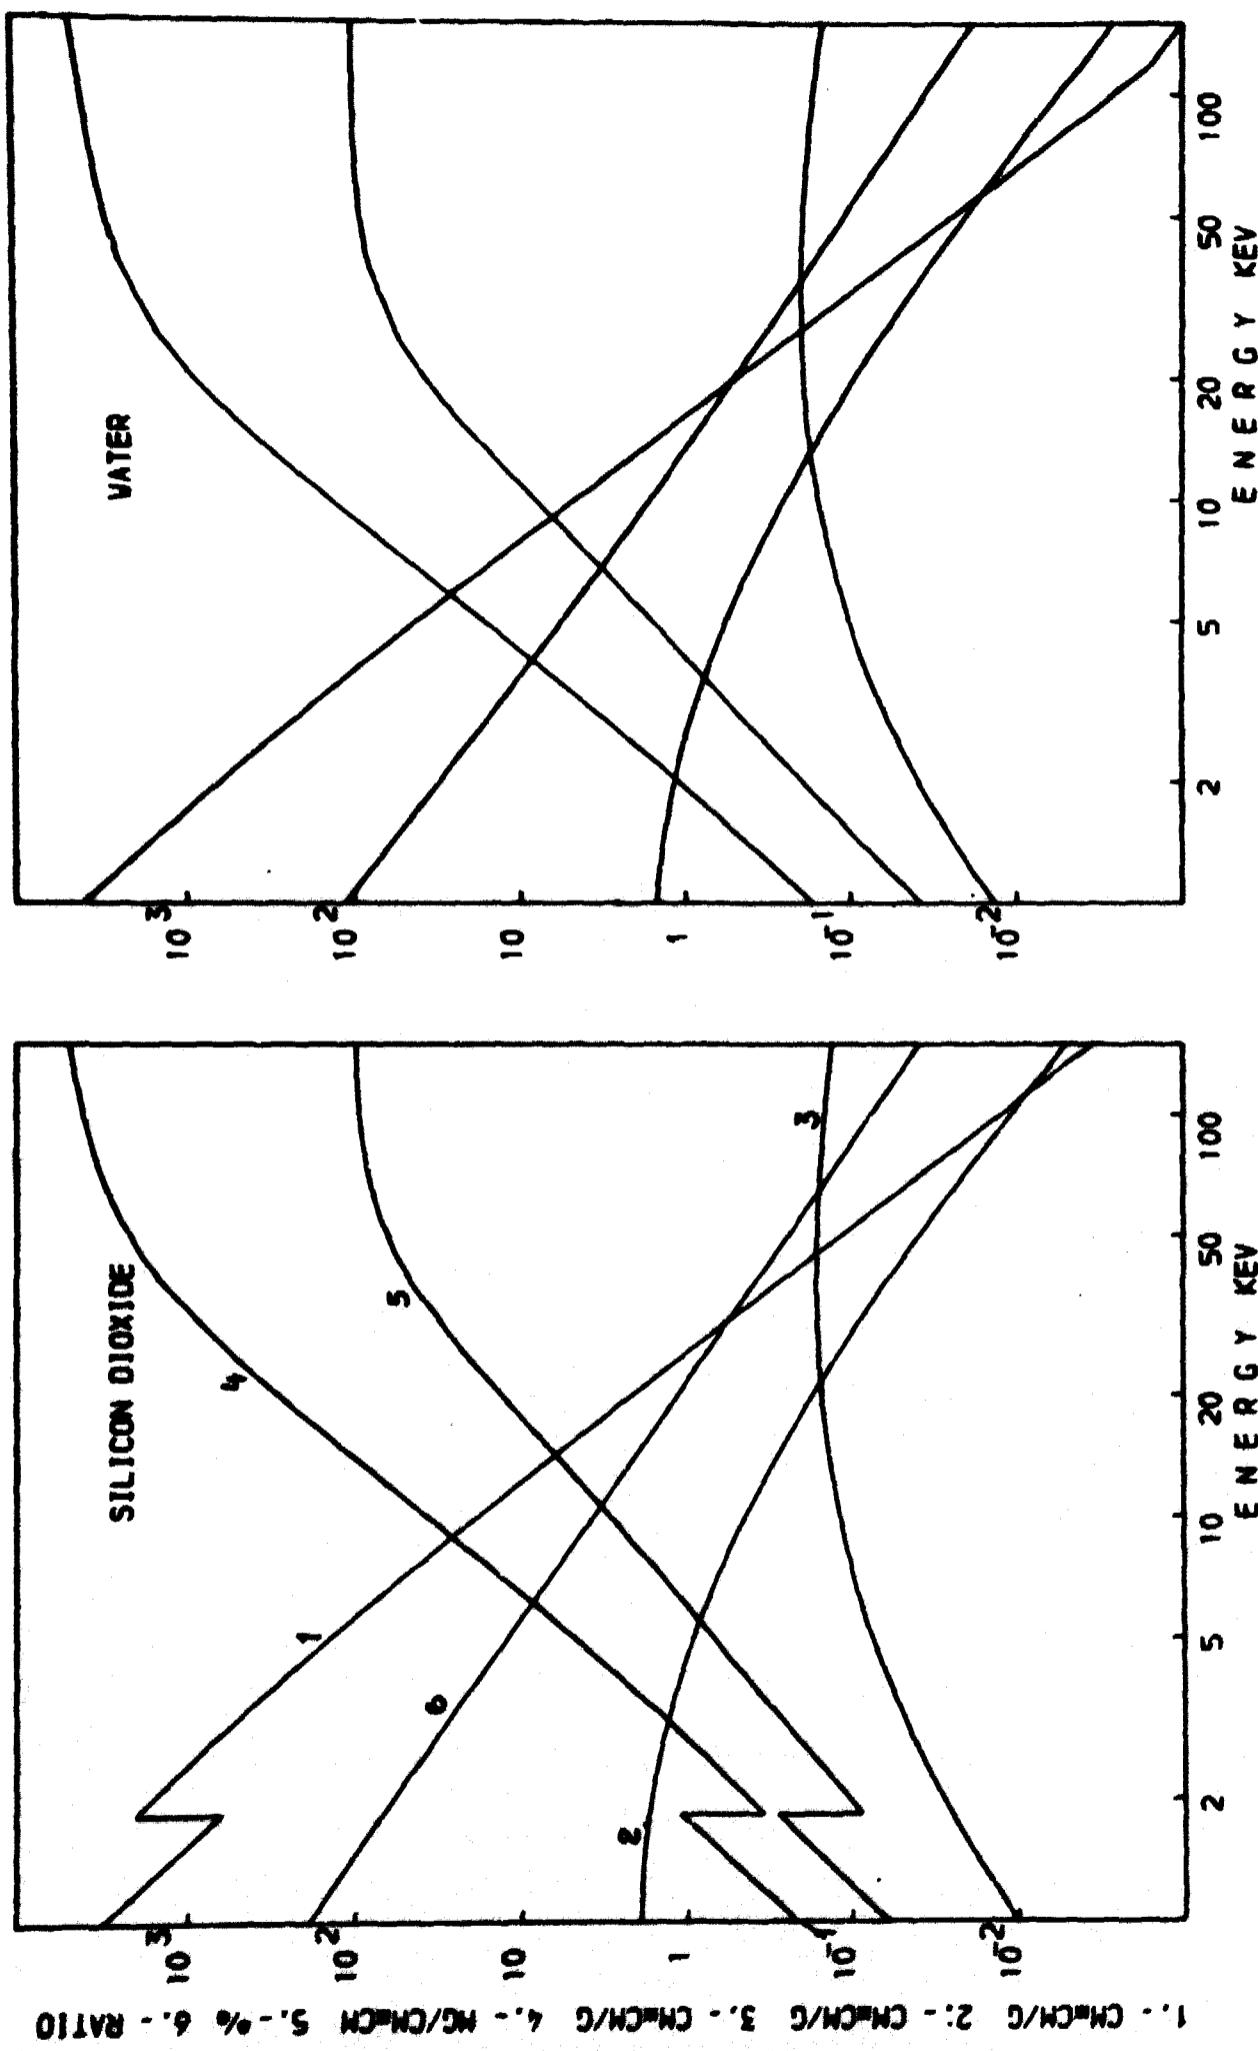

Fig. 6. X-ray interaction data for SiO_2 and water plotted vs. X-ray energy. For explanations of numbers and dimensions see fig. 1.
