The challenge: Implementing future low-energy cities
Urban densification is a key strategy - but what is the balance between density, daylight and sun?

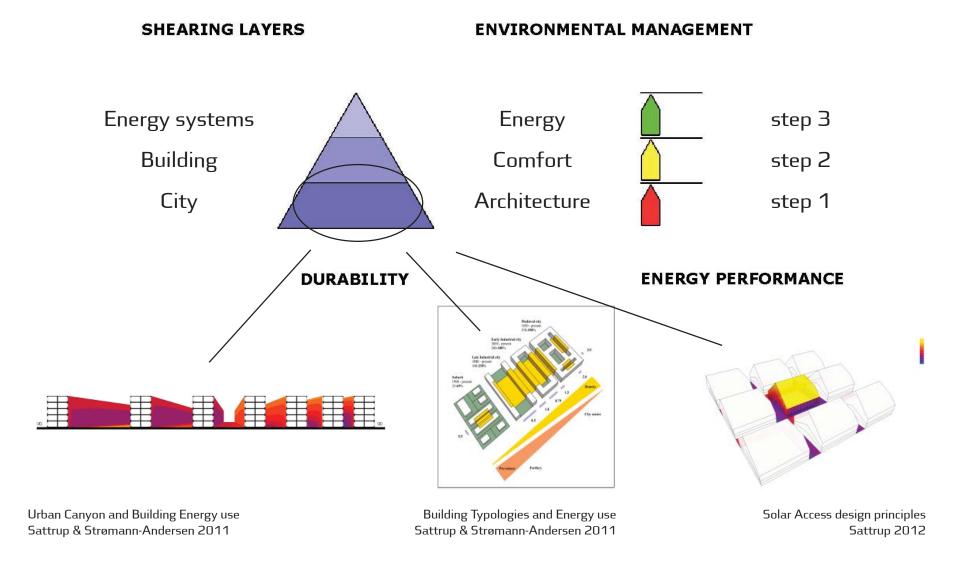

Louisiana - Green Architecture for the Future 2009

Copenhagen - Urban Microclimates, Peter Andreas Sattrup 2009

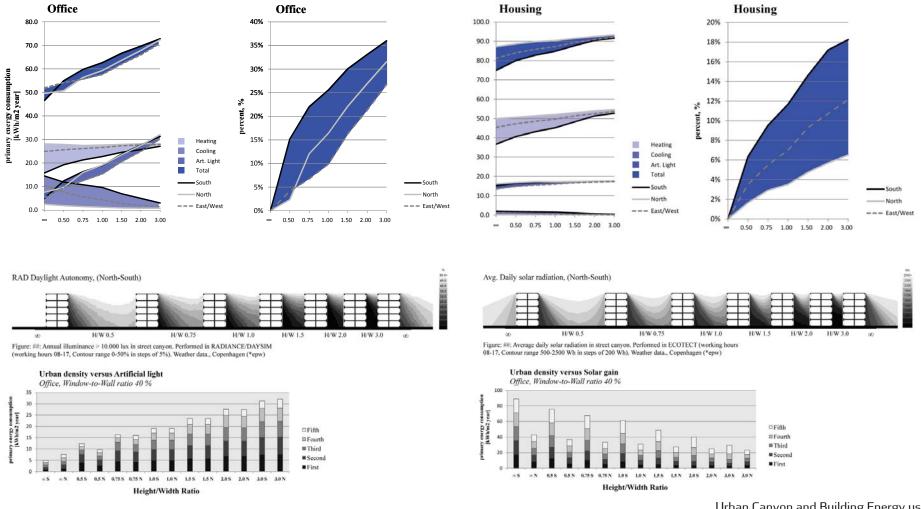

The form and materials of urban spaces create special urban microclimates.

The quality of the urban environments affect the indoor climate of buildings and their energy use.

Environmental design and energy optimization starts at the level of the City.

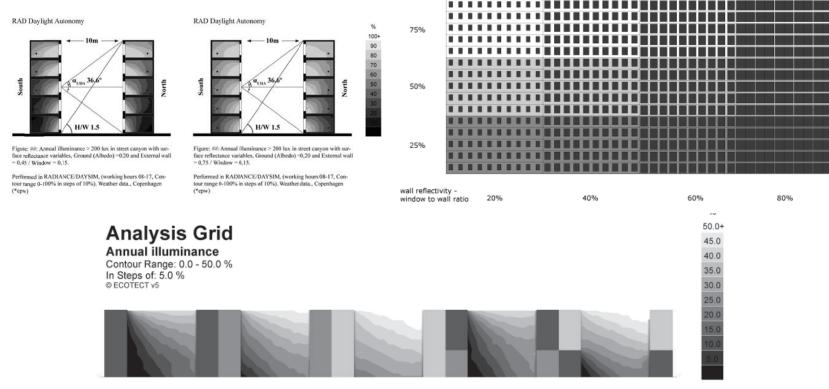

What are the impacts of urban design on daylight, solar heat gains and building energy use?

Urban Canyon and Building Energy use Sattrup & Strømann-Andersen 2011

Environmental design and energy optimization starts at the level of the City.

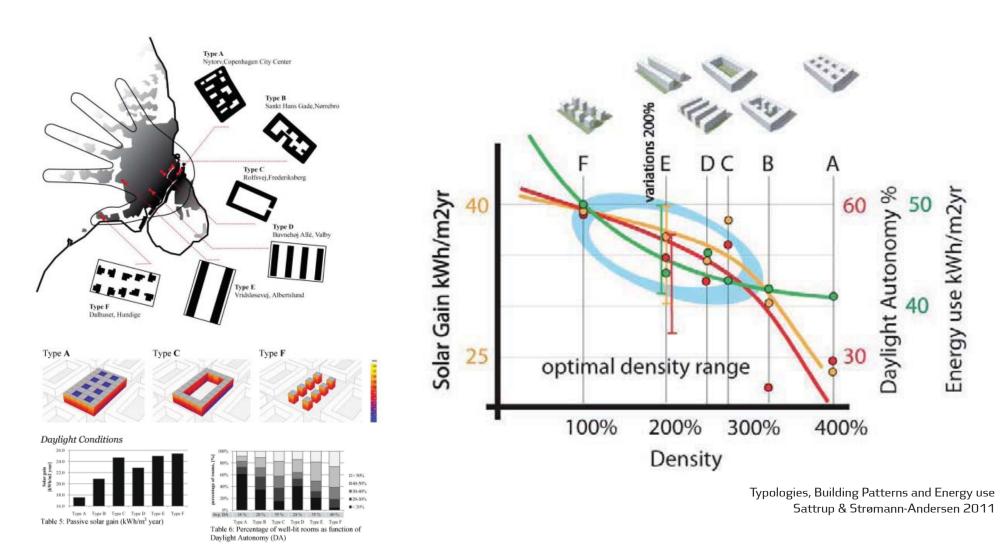

Daylight becomes an increasingly important energy parameter in low-energy city cities

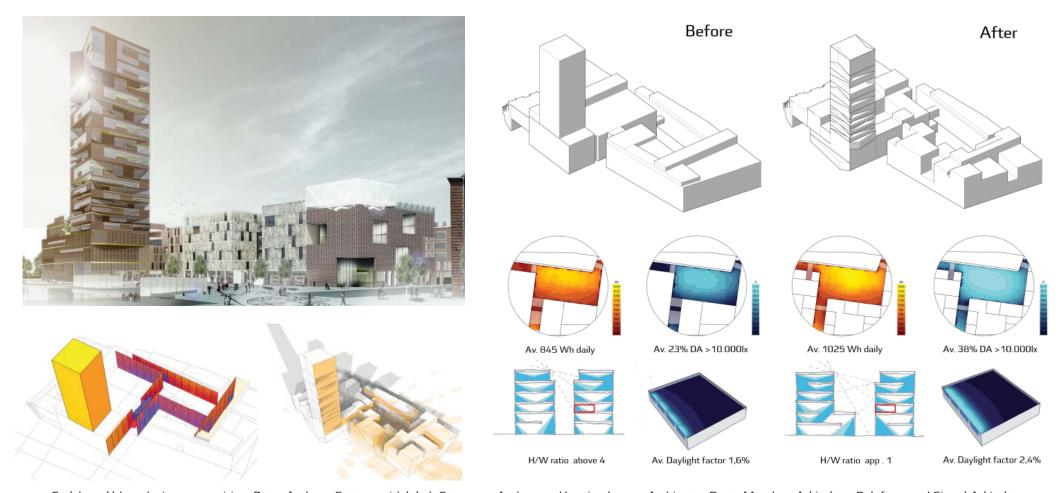

Annual illuminance > 10.000 lux in street canyon. Performed in RADIANCE/DAYSIM (working hours 08-17, Contour range 0-50% in steps of 5%). Weather data., Copenhagen (*DRY)

Glazing Ratios, Reflectivity and the Urban Daylight potential Sattrup & Strømann-Andersen 2011

Urban daylight distribution is strongly affected by the design of buildings. Buildings may increase or decrease the daylight availability of neighbouring buildings.

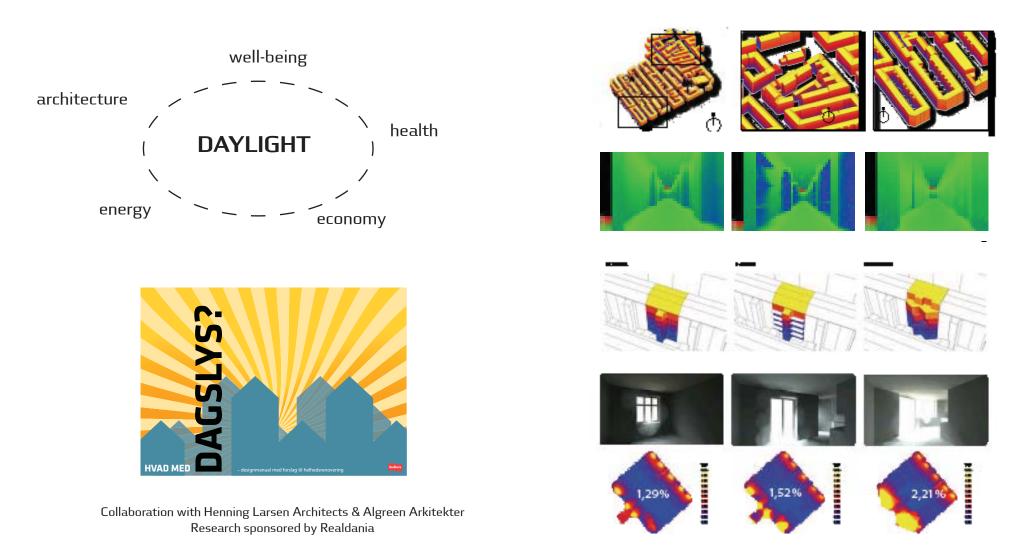

The optimal urban density range is quite higher than the suburban landscape of single family homes of today, but there are upper limits. Major improvements can be achived through design.

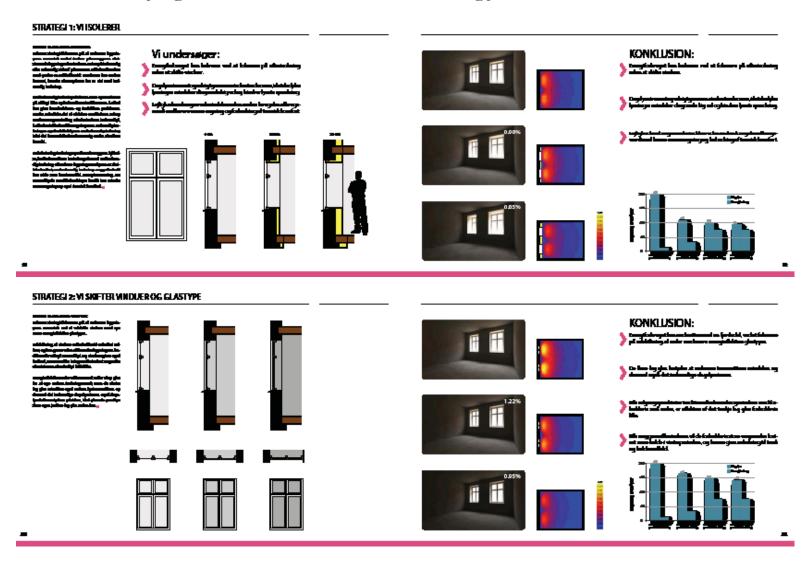

Carlsberg Urban design competition: Peter Andreas Sattrup withJakob Strømann-Andersen - Henning Larsen Architects, Dorte Mandrup Arkitekter, Polyform and Signal Arkitekter

Urban design may have profound impacts on Daylight Availability.

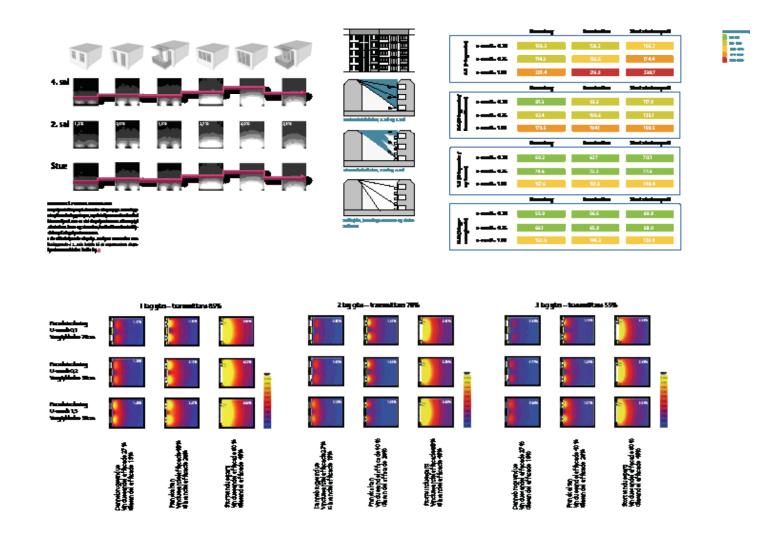

In the Carlsberg case Daylight Availability was increased by >150% - through urban design

Case: Developing urban design guidelines for transformation of existing cities in Denmark Focussing on daylight rather than technical optimization alone creates value on all parameters

The Design guidelines offer a 'tool box' to planners, administrators, designers and clients The tool box allow them to navigate the consequences of different optimization strategies

The Design guidelines offer a 'tool box' to planners, administrators, designers and clients The tool box allow them to navigate the consequences of different optimization strategies

Some thoughts:

Daylight and solar acces are important resources in the future quality of urban environments and energy efficiency of cities.

Environmental design and energy optimizations starts at the level of urban design.

We need more knowledge - but first of all we need to disseminate the existing knowledge in practice

Design guidelines may be an important instrument in this process

Thank you!
