KATA PENGANTAR

Segala puji syukur kita panjatkan kehadiran Allah SWT., yang telah memberi kelimpahan bagi umatNya. Kami, dewan redaksi, Jurnal Informatika Komputer khususnya memanjatkan puji syukur kepadaNya karena dengan berkatNya lah jurnal ini dapat terbit.

Jurnal Informatika Komputer Nomor 1, Volume 14 April 2009 ini memuat 8 (delapan) artikel. Analisis pengolahan citra yang menggunakan teknik biometrik seperti ciri wajah dan sidik jari seseorang sangat menarik untuk disimak para pembaca. Selain itu edisi kali ini banyak mengetengahkan teknologi komunikasi data yang diimplementasikan untuk kepentingan masyarakat.

Penelitian mulai dilaksanakan secara terus menerus dalam kehidupan, ditambah dengan ketekunan dan semangat para dosen bidang teknologi informasi di perguruan tinggi, khususnya di Universitas Gunadarma,

menjadikan majalah ini semakin dibutuhkan untuk diterbitkan. Semangat para dosen meneliti dan mempublikasikan hasilnya, terlihat dari semakin banyaknya artikel yang masuk ke meja redaksi.

Kami masih mengharapkan untuk mendapatkan tanggapan yang dapat menyempurnakan penerbitan jurnal ini dari pembaca. Diskusi ataupun saran pembaca pada peneliti akan menjadi unsur penyempurnaan pada penelitian yang dilakukan. Untuk itu, kami tidak bosan-bosannya mengajak para pembaca untuk memberikan kritik atau tanggapan yang membangun atas artikel yang dimuat di jurnal ini. Kritik dan tanggapan yang diberikan diharapkan akan semakin menyempurnakan penelitian selanjutnya.

Akhir kata kami ucapkan selamat membaca, semoga apa yang kami berikan ini berguna bagi para pembaca yang budiman.

ABSTRACT

The idea of e-mail brings this world into the revolution in digital information. Today, e-mail is a communication media which is very popular. In order to send and receive e-mail, it needs a server which provide email service. This application usually calls Mail Transfer Agent (MTA). One of MTA that usually used is Zimbra. This research tries to implement and optimize the mail server Zimbra which install in operating system Centos 5.0. Testing of optimization is conducted by setting account in administration and makes a communication with e-mail.

Keyword(s) : mail server, MTA, operating system, Zimbra

Subject Description : H.4.Information System Applications | H.4.3. Communications Applications | Electronic Mail

INTRODUCTION

Letter is tool that can be used to communicate since long time ago. The advantage of letter is protecting the personal message. Together with prosperity of technology information, also make the mail technology grow up according to request. The utilization of e-mail starts to move up the traditional letter.

E-mail is one of internet services that are needed in public modern business. Almost big, middle and small company uses it. E-mail has more advantage than fax, telephone and SMS. E-mail is cheaper and faster.

E-mail server is like a post office which has job to receive and send mail into the correct address. Yahooemail.com, hotmail.com, and

Gmail.com which grow up now are examples of mail server technology.

Mail Server executes an application used to process mail progress. This application always called Mail Transfer Agent (MTA). Even though the application that runs in another computer which is serviced with server is called Mail Client (MC) [7]. There are some mail servers that are used in internet networking and walking on Operating System Linux/ UNIX. Some of them are Sendmail, Qmail, Postfix and Zimbra. This Zimbra mail server has different advantage and disadvantage.

Zimbra is web based collaboration system which is not just has mail server feature, but also has a lot of prosperity that can be good choice for company which want to implement it. Moreover Zimbra excellent capability is not just in collaborating but also in integrating all features in this system to another system, like Enterprise Resource Planning (ERP), Costumer Relation Management (CRM) or application that built by itself. Zimbra enables to share calendaring, to-do list management based on team work and to manage mailing list all.

For a company mail server is very important to send information fast and arrived in correct address to all employee. Except that all employee can access this e-mail from internet.

The main question is about the level of user friendly, learning curve and utilize the application. There are many approach to consider the level, in the research we will find out the practical method to measure the level of the application.

RESEARCH METODOLOGY

The approach of the research is based on practical view. For this purpose we will examine the application with some factors in practical from users or operators view. Refer to the result of operators view, the level of application in some parameter of user

friendly, learning curve and utilize can be considered.

RESULT AND DISCUSSION

Step Building and Analysis Design Analysis Design

There are some steps to build mail server.

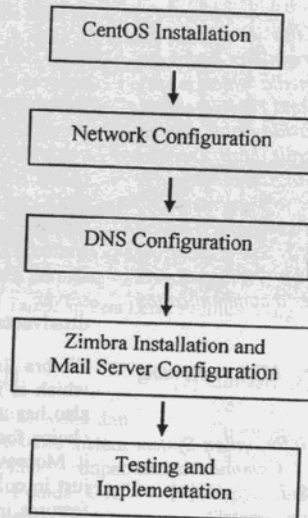

Figure 1. Flowchart Design

Installation and Configuration

Operating System Installation

In building this mail server, CentOS 5.0 operating system is used. This installation process was begun with booting in DVD-ROM, so it must change the bios setting. The purpose is, while system is booting, BIOS would read the DVD-ROM not the harddisk.

CentOS Operating System installation could do in two ways. Graphique mode or Text Mode. It uses text mode to install this OS. First to use text mode write "Linux text" in prompt boot and then enter.

In installation process, there are some buttons that can use to such as: navigation button, tab button, space button and enter button.

There are steps in installing the OS :

1. Choose language that will use for installation
2. Choose the type of keyboard (Choose type "us", click ok)
3. Choose the partition type

There are 4 types of partition :

- a. Remove all partitions on selected drives and create default layout
- b. Remove Linux partitions on selected drives and create default layout

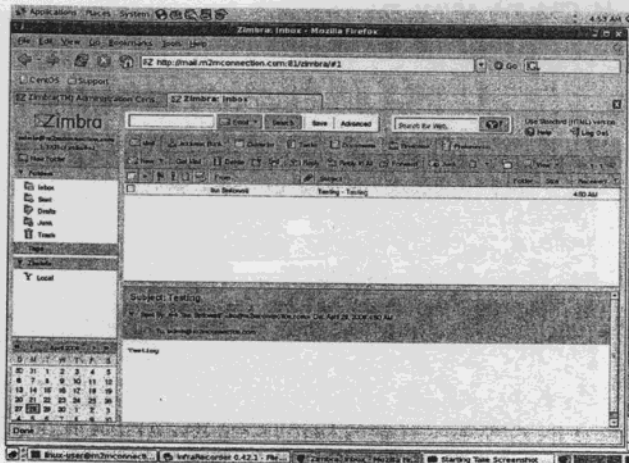

Figure 15. Home Email

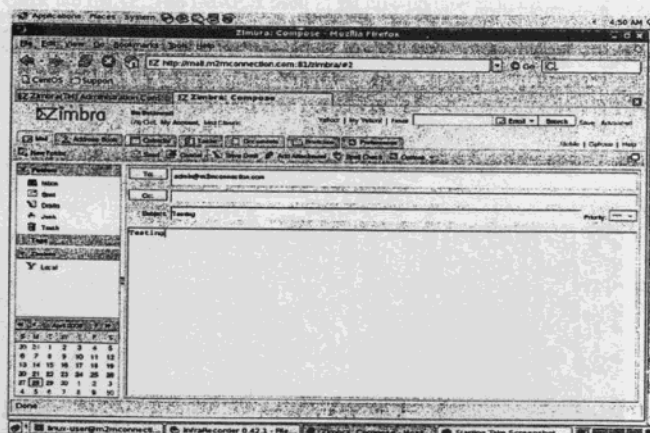

Figure 16. Email Compose

After success with OS installation and configuration, the next step is email server installation, configuration and testing. The general command of operator in this step are :

- the installation is very similar with general application in Linux
- the advantages of installation and configuration are user interface in graphic (web based) and command line, help in package or internet is appropriate for simple task
- the minor disadvantage is lack of add-on for the product.

CONCLUSION AND SUGESTION

Building mail server in PT M2M Connection using Zimbra and operating system CentOS could be new communication system media in this company. Zimbra is a mail server application which has a lot of advantages, so it is appropriate with the needs of the users. Mail server can work well if Domain Name Server (DNS) can generate the Internet Protocol (IP). User just can access the e-mail that has receive in mail client that is connected to mail server

Installation and configuration of OS and Zimbra is relatively easy for administrator who familiar with Unix like operating system. The main advantage is user interface and help file. Need of some add on and performance are very interesting to be next step in the research of email server.
