Bedeck, J., Taiti, S. & Gottstein, S.: Catalogue and atlas of cave-dwelling terrestrial isopods (Crustacea: Oniscidea) from Croatia. Nat. Croat., Vol. 20, No. 2., 237–354, 2011, Zagreb.

This paper presents a checklist with historical overview and new records on the cave-dwelling terrestrial isopods (troglophiles and troglobionts) from Croatia, based on detailed analyses of available literature and unpublished data from collections. For each species the following data are quoted: the name of the taxon; synonyms; general distribution; type locality; ecological status; list of locality records; species names used in the cited literature; the distribution map using 10 × 10 km UTM grid squares. Annexes with the locality synonyms used in the examined literature and collection data are enclosed. Altogether this paper presents data from 557 caves, 6 artificial underground structures and 15 other epigean and subterranean localities. A checklist of cave terrestrial isopod taxa in Croatia is composed of 35 species and five subspecies distributed in five families, including 22 Croatian endemic and 20 troglobiotic taxa. The family Trichoniscidae and the subfamily Trichoniscinae are the most representative with 26 and 20 species, respectively. The most represented genus is *Alpioniscus* with 10 species. The South Croatian Littoral macroregion has the highest number of species and endemics among Croatian macroregions. The most widely distributed species in Croatia are the troglophiles *Mesoniscus graniger* and *Androniscus roseus* found in three macroregions. Only four troglobiotic species (*Alpioniscus balthasari*, *A. strasseri*, *Titanethes albus* and *T. dahlii*) are distributed in two macroregions, while the rest are distributed only in single macroregions. All the 40 Croatian cave taxa are distributed in the Dinaric karst area, and only three troglophilic species are found also outside. No Croatian endemic taxa are found outside the Dinaric karst area.

Key words: checklist, endemic taxa, Dinaric karst, biodiversity, distribution

Bedeck, J., Taiti, S. & Gottstein, S.: Katalog i atlas špiljskih kopnenih jednakožnih rakova (Crustacea: Oniscidea) Hrvatske. Nat. Croat., Vol. 20, No. 2., 237–354, 2011, Zagreb.

U ovom radu je prikazan popis vrsta s povijesnim pregledom i novim nalazima špiljskih jednakožnih kopnenih rakova, koji se temelji na detaljnoj analizi dostupne literature o špiljskim jednakožnim rakovima te neobjavljenim podacima iz zbirki. Popisani su svi poznati špiljski jednakožni rakovi (troglofili i troglobionti). Za svaku vrstu se navode sljedeći podaci: ime svojte; sinonimi; opća

rasprostranjenost; tipski lokalitet; ekološki status; popis nalaza; ime vrste upotrijebljeno u citiranoj literaturi; karta rasprostranjenosti na UTM mreži 10×10 km. Priloženi su dodaci s popisom sinonima objekata upotrijebljenih u citiranoj literaturi te podaci iz zbirki. Sveukupno rad obuhvaća podatke iz 557 speleološka objekta, šest podzemnih građevina i 15 ostalih nadzemnih i podzemnih lokaliteta. Popis šipljih svoji utvrđeni do danas za područje Hrvatske obuhvaća 35 vrsta i pet podvrsta unutar pet porodica koje uključuju 22 endema Hrvatske i 20 troglobionata. S obzirom na broj vrsta najzastupljenija je porodica Trichoniscidae (26 vrsta) i potporodica Trichoniscinae (20 vrsta). Rod *Alpioniscus* sa 10 vrsta je najučestaliji. Makroregija južno hrvatsko primorje ima mnogo više vrsta i endema od ostalih regija. Najšire rasprostranjene vrste su troglofilne vrste *Mesoniscus graniger*, *Androniscus roseus* i troglobiontna vrsta *Androniscus stygius*, rasprostranjene u tri makroregije. Samo četiri troglobiontna vrste (*Alpioniscus balthasari*, *A. strasseri*, *Titanethes albus* i *T. dahli*) su rasprostranjene u dvije makroregije, ostale su utvrđene samo u jednoj. Od 40 šipljih svoji sve su rasprostranjene u Dinarskom kršu a samo tri izvan Dinarskog krša. Izvan Dinarskog krša nema Hrvatskih endemske svojstva.

Ključne riječi: popis vrsta, endemi, dinarski krš, bioraznolikost, rasprostranjenost

INTRODUCTION

In Croatia 130 species and 30 subspecies of terrestrial isopods have been recorded to date, 59 species and 17 subspecies being endemic to Croatia (ARCANGELI, 1939a, POTOČNIK, 1989, SCHMALFUSS, 2003, FARKAS & KRČMAR, 2004, FARKAS & VILISICS, 2008, BEDEK & TAITI, 2009, KARAMAN *et al.*, 2009). This paper presents an overview of the present knowledge on cave-dwelling terrestrial isopods, and is based on data available in the literature and unpublished data from collections.

HISTORICAL REVIEW

The first known data about terrestrial isopods from Croatian caves were given by the school teacher **Eugen Adolf Jurinac** from Varaždin. He performed the first systematic biospeleological research in the period from 15th to 31st August 1883 in the Kordun region. Among other cave animals he collected *Titanethes albus* (C. Koch, 1841) in three caves in the Ogulin region (JURINAC, 1886, 1888). In the beginning of the 20th century the director of the Croatian Natural History Museum **August Langhoffer** led major biospeleological surveys in Kordun, Gorski Kotar, Lika and Zagreb (LANGHOFFER, 1912, 1915a, 1915b) and the entomologist **Victor Stiller** from Zagreb also explored Kordun and Gorski Kotar (STILLER, 1911a, 1911b, 1913, 1914). The Dalmatian cave fauna was first investigated by **Umberto Girometta**, a school teacher and speleologist from Split, and his students from 1912 to 1914 (GIOMETTA, 1913, 1914). A mammalogist from Vienna, **Otto Wettstein**, explored

caves on the island of Brač in 1912 in an expedition organized by the biologist Prof. Dr. Franz Werner (WETTSTEIN, 1914). They all collected different species of the genera *Alpioniscus*, *Androniscus* and *Titanethes*, but mostly misidentified them as *Titanethes albus* or *Trichoniscus roseus*. All known data from that period were reviewed by the Hungarian isopodologist Ernő Csiki in his famous paper »Magyarország szárazföldi Isopodái. (Isopoda terrestria Hungariae)« (CSIKI, 1926).

From the beginning of the 20th century many foreign biologists (mostly entomologists) collected numerous specimens from caves, including terrestrial isopods. The collected material resulted in a lot of new species being described, mostly in the thirties of the last century. The first scientific analyses date to 1926, when the Italian isopodologist Alceste Arcangeli described the troglophilic species *Oroniscus stentai* (as *Porcellio stentai*) from Brač; this had been collected in 1903 by Josef (Giuseppe) Müller, coleopterologist from Trieste, born in Zadar (ARCANGELI, 1926). The German isopodologist Karl Verhoeff analyzed material from Istria collected by the diplopodologist Karl Strasser (VERHOEFF, 1929a, 1929b). The Hungarian isopodologist Adorján Kesselyák described the troglophilic subspecies *Androniscus stygius microcaverniculus* (as *Androniscus roseus microcaverniculus*), which he had collected on Mt. Učka in 1928 and 1929 (KESSELYÁK, 1931). Verhoeff described two new troglobiotic species from the island of Korčula collected by German zoologist Fritz Haas, *Alpioniscus haasi* (as *Illyrionethes haasi*) and *Aegonethes cervinus* (as *Illyrionethes cervinus*) (VERHOEFF, 1931a, 1931b). A new troglophilic subspecies from Istria, *Androniscus roseus histriana* (as *Trichoniscus roseus histriana*), collected by Italian biologist Pietro Parenzan, was described by Arcangeli (ARCANGELI, 1932). Czech biologist Karel Absolon, one of the most famous explorers of Dinaric caves, collected fauna on the island of Mljet in 1917. Out of that material the Austrian isopodologist Hans Strouhal in 1934 described the troglophilic species *Echinarmadillidium absoloni*, for which Verhoeff in 1939 described a new genus, *Cyphodillidium* (STROUHAL, 1934, VERHOEFF, 1939). The Slovak isopodologist Zdeněk Frankenberger made a two-week-long fieldtrip in Dalmatia in June 1937 and described the new troglobiotic species *Alpioniscus balthasari* (as *Illyrionethes balthasari*) (FRANKENBERGER, 1937). In the same year Strouhal described two new troglophilic species from the genus *Oroniscus* collected by Absolon in 1914 from central Dalmatia (*O. dalmaticus*) and in 1917 from the island of Mljet (*O. meledensis*) (STROUHAL, 1937). The German biospeleologist Beno Wolf listed all cave isopods known up to 1935 in his famous »Animalium Cavernarum Catalogus« (WOLF, 1938). The Czech arachnologist Josef Kratochvíl collected material from Dalmatia on his fieldtrips through the former Yugoslavia. His material was analyzed by Frankenberger who described five new species: *Typhlarmadillidium kratochvili* (as *Cylisticus kratochvili*) from the island of Korčula, *Alpioniscus magnus* (as *Illyrionethes magnus*) from the island of Brač, *Alpioniscus kratochvili* (as *Illyrionethes kratochvili*) from the island of Hvar, and *Cyphopleon kratochvili* (as *Cyphoniscellus kratochvili*) from Mt. Svilaja. He also erected the new genus *Aegonethes* for the species *Illyrionethes cervinus* from the islands of Korčula and Vis. The new species *A. antilocapra* is also described by FRANKENBERGER (1938a, 1938b, 1939). Strouhal analyzed material from the Natural History Museum in Vienna, collected by Czech coleopterologist Joseph Klimesch in 1913 and Werner in 1927, and described the new troglobiotic species *Alpioniscus verhoeffi* (as *Illyrionethes verhoeffi*) from the Neretva River collected by Austrian biologist Joseph Erber in 1861 (STROUHAL, 1938). He also analyzed material from the collection »Biospeleo-

logica balcanica« gathered by **Absolon** and published the results in a series of papers named »*Landasseln aus Balkanhöhlen, in der Sammlung Biospeleolgica balcanica*« and »*Landasseln aus Balkanhöhlen, gesammelt von Prof. Dr. K. Absolon*«. Many researchers besides **Absolon** contributed in collecting terrestrial isopods. **Strouhal** published many new biogeographical data for a lot of species and described many new genera and species from the Balkan region. From Croatia he described the new genus and species *Troglocyphoniscus absoloni* from the island of Mljet (STROUHAL, 1939a, 1939b, 1939c, 1939d, 1939e). In 1940 **Frankenberger** and **Strouhal** summarized all the data, which ended a very important period for the knowledge of cave terrestrial isopods in Croatia.

In the fifties and the sixties of the last century the isopodologist **Adem Buturović** from Sarajevo continued the study of terrestrial isopods on material collected by the arachnologist **Franjo Nikolić** from Dubrovnik from 1951 to 1953, by the Serbian biologist **Stanko Karaman** from 1924 to 1953, and material collected by himself in 1954. He described the new troglophilic subspecies *Trichoniscus matulici metkovicensis* from the surroundings of Metković and the troglobiotic species *Alpioniscus trogirensis* from the surroundings of Trogir, and added many new biogeographical data for other known species (BUTUROVIĆ, 1955b, 1955c, 1963). In 1966 the biologist **Mladen Karaman**, son of **Stanko Karaman**, published a complete review of terrestrial isopods from Yugoslavia (KARAMAN, 1966). After that there was one long period of silence, which was ended by the Slovenian isopodologist **Franc Potočnik** with the description of the troglobiotic species *Alpioniscus christiani*, collected on the island of Krk by the Austrian collembologist **Erhard Christian** (POTOČNIK, 1983). **Potočnik** carried out a survey of the fauna of terrestrial isopods of Yugoslavia (POTOČNIK, 1989).

Since 1970 the biospeleologist and technician from the Croatian Natural History Museum **Branko Jalžić** has collected material of terrestrial isopods from Croatia (JALŽIĆ & BOŽIČEVIĆ, 1975, KEROVEC *et al.*, 1999, JALŽIĆ, 2001). With many colleagues he established the Croatian Biospeleological Society in 1996. During biospeleological research since 1989 **Roman Ozimec** has collected terrestrial isopods (OZIMEC, 2003, OZIMEC, 2009), and assembled a great amount of references. Since the 1990s, terrestrial isopods have been collected also by **Tonći Rađa** (VUJČIĆ-KARLO & RAĐA, 2004). Through the work of the Croatian Biospeleological Society many people have become involved in the collection of cave animals, including terrestrial isopods: **Marijana Franičević**, **Tomica Rubinić**, **Hrvoje Cvitanović**, **Gordan Polić**, **Stipe Bušelić**, **Helena Bilandžija**, **Marko Lukić**, **Martina Pavlek**, **Predrag Rade**, **Ana Komerički**, **Kazimir Miculinić**, **Robert Baković**, **Vedran Jalžić**, **Fanica Kljaković Gašpić**, **Alen Kirin**, **Petra Kovač Konrad**, and some young biology students such as **Petra Bregović**, **Nikolina Raguž**, **Tamara Čuković**, **Andela Ćukušić**, **Lana Đud**, **Dajana Hmura**, **Marta Malenica**, **Petra Kutleša** and many others. Most of these samples have been examined by J. Bedek since 2000 (BEDEK *et al.*, 2000, GOTTSSTEIN MATOČEC *et al.*, 2002, OZIMEC, 2004, 2005, OZIMEC & BEDEK, 2005, BEDEK 2005a, 2005b, 2007a, 2007b, JALŽIĆ *et al.*, 2007, BAKŠIĆ *et al.*, 2008, BEDEK *et al.*, 2008, OZIMEC *et al.*, 2008, LUKIĆ *et al.*, 2009), which resulted in the descriptions of two new species in 2009: *Strouhalonisculus biokovoensis* from Mt. Biokovo (BEDEK & TAITI, 2009), and *Thaumatoniscus speluncae* from Mt. Učka (KARAMAN *et al.*, 2009) The present paper deals with part of the results from field work carried out in the last 15 years by the Croatian Biospeleological Society and the Croatian Natural History Museum; the remaining results with descriptions of several new taxa will be published in future papers.

MATERIALS AND METHODS

This paper is based on a review of data of all available literature and on unpublished data. Cave-dwelling taxa of terrestrial isopods (troglophiles and troglobionts) are listed in this catalogue with all known locality records, both from subterranean and epigean environment.

Unpublished data come from projects of the Croatian Biospeleological Society and the Croatian Natural History Museum on the cave fauna of Croatia. Only taxa identified to the level of species and subspecies are listed, while unidentified specimens and new species are not included. A lot of material was collected in cooperation with other organizations, especially the speleological societies: SO PDS Velebit, SO HPD Željezničar, DDSKF, SK Samobor, SK Ursus spelaeus, SU Estavela, SU Spelunka, SO PD Dubovac, SD Karlovac and the Biological Students Society BIUS. Part of the Crustacea Collection from the Croatian Natural History Museum was also examined, collected in 1883 by Adolf Jurinac, in 1902 by August Langhoffer, and by Dragutin Hirc (unknown date).

Isopods in caves were collected using tweezers in all habitats and preserved in 75% ethanol with glycerol. Micropreparations in Hoyer's medium of the most important body parts were used for identifications. The collected material has been deposited in the collections of the Croatian Biospeleological Society, the Croatian Natural History Museum, the Museo di Storia Naturale dell'Università di Firenze, Sezione di Zoologia »La Specola« in Italy, the Department of Biology and Ecology, Faculty of Sciences, University of Novi Sad, Serbia and the Tonći Rađa private collection. The collection of the Croatian Biospeleological Society has been deposited in the Croatian Natural History Museum.

For each species the following data are quoted:

1. Ordinal number. All taxa are marked with Arabic numerals. Taxa that are only doubtfully present in Croatia are not marked with a number.
2. Taxa names. Taxonomic arrangement and nomenclature follows SCHMALFUSS (2003).
3. Synonyms.
4. Distribution.
5. Type locality. The valid name is given with original names of type localities in square brackets.
6. Ecological status. If there are no literature data, ecological status is given according to SKET (2008).
7. List of localities.
 - The valid names of the localities in Croatian language according to topographic and speleological nomenclature are included. Frequent terms for types of feature are: špilja, spilja, spila, peć, pećina = cave; jama, jametina, rupa = pit; kaverna = cavern; ledenica = ice cave; sniježnica = snow cave; izvor špilja = spring cave; ponor = sinkhole; pukotina = crevice; sustav = cave system; rudnik = mine.
 - Localities are listed by level of precision of given locality (the most precise localities are at the beginning), then by alphabetical order of UTM grid squares, then by alphabetical order of the name of the locality. Misidentifications, doubtful data and misinterpreted data are placed at the end of the table.

- The UTM grid with squares of a 10×10 km is used. Data are taken from the UTM 1:500000 map of the world. If it is not established in which UTM square the feature is located, when possible the UTM reference for a 100×100 km field is given.
 - The macroregion reference according to ROGLIĆ (1974) is given.
 - Source of the record is given.
8. Species names used in cited literature, whether they are misidentifications or misprints, are listed below the table with listed localities.
9. The Croatian distribution of each species is mapped using the 10×10 km UTM grid squares on the map of Croatian territory with macroregions according to ROGLIĆ (1974) (Fig. 1). The other less precise localities are not mapped, except if they are distant from other localities of that taxa. The localities for which the 10×10 km UTM square is precise are marked with a circle or triangle and localities for which the 10×10 km UTM square is not precise are marked with a transparent square.
10. Locality names used in the references with their present real name are listed by alphabetical order in Appendix 1. In Appendix 2 collection records with collector(s) and dates are given. All localities with their present real name are listed in alphabetical order in Appendix 3.

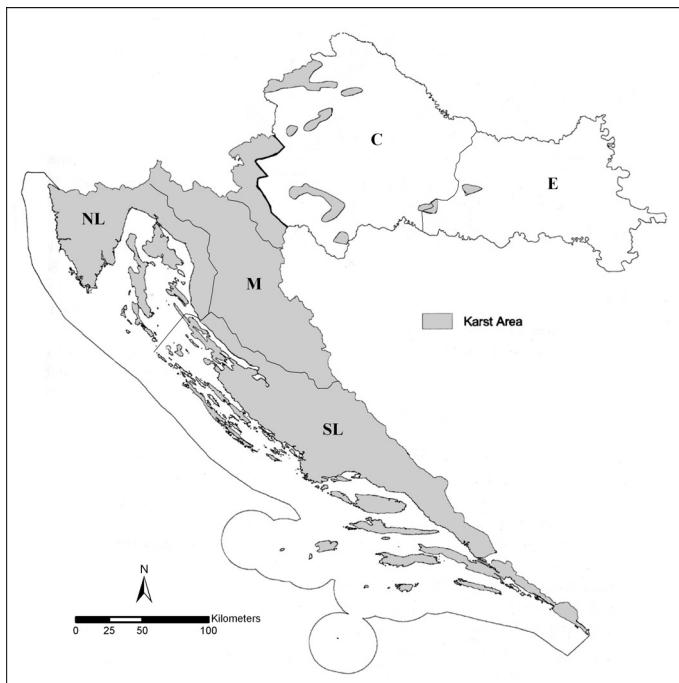

Fig. 1. Croatian macroregions defined according to ROGLIĆ (1974) with the distribution of karst areas according to GOTTSSTEIN MATOČEC *et al.* (2002). The Dinaric karst is divided with a thick line. E (Eastern Croatia); C (Central Croatia); M (Mountainous Croatia); NL (Northern Croatian Littoral); SL (Southern Croatian Littoral).

RESULTS

MESONISCIDAE

1. *Mesoniscus graniger* (Frivaldszky, 1865) (Tab. 1, Fig. 2)

- Synonyms: *Titanethes graniger* Frivaldszky, 1865; *M. alpicola meridionalis* Chappuis, 1944; *M. alpicola vulgaris* Chappuis, 1944; *M. histriana* Arcangeli, 1939; *M. prenjanus* Arcangeli, 1939; *M. triangulifer* Verhoeff, 1930; *Nematoniscus illyricus* Verhoeff, 1933; *N. prenjanus* (Verhoeff, 1901); *N. triangulifer* Verhoeff, 1930; *Schiödta graniger* (Frivaldszky, 1865); *Titanethes graniger* Heller, 1858; *Trichoniscus prenjanus* Verhoeff, 1901
- Distribution: Slovenia, Serbia, Bosnia and Herzegovina, Slovakia, Romania (SCHMALFUSS, 2003); Croatia (ARCANGELI, 1939a)
- Type locality: Baradla barlang (cave system), Aggtelek, Hungary [Aggteleki barlang (FRI-VALDSKY, 1865)]
- Ecological status: In caves, but also under big rocks in deep soil (GIURGINCA, 2009); troglophilic

*Monte Maggiore is most probably Učka Mt. in Istria, as indicated by the species name (*M. histriana*), junior synonym of *M. graniger*)

**In this paper the locality is placed in Italy, Julian Alps instead in Istria, Croatia.

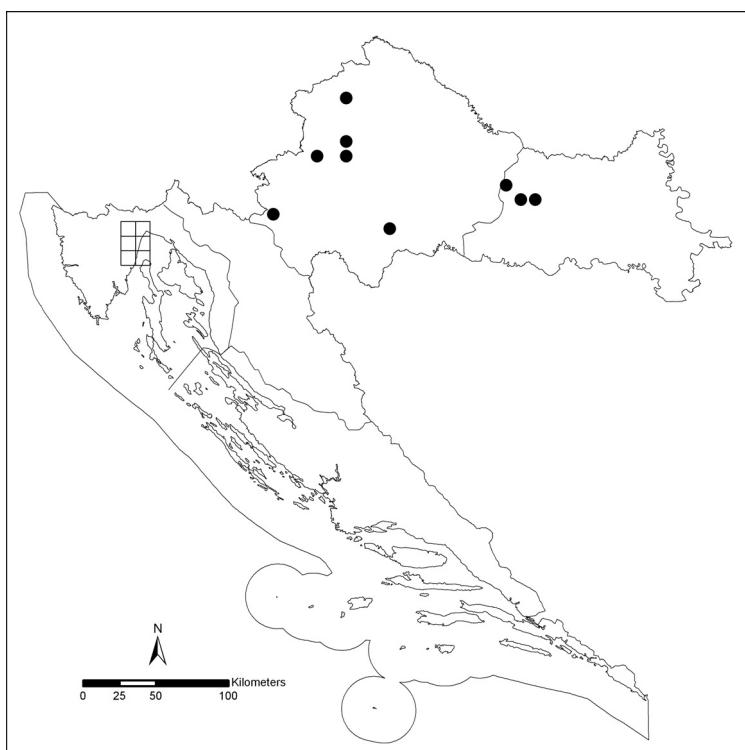

Fig. 2. Croatian distribution of *Mesoniscus graniger*.

TRICHONISCIDAE: TRICHONISCINAE

2. *Androniscus dentiger* Verhoeff, 1908 (Tab. 2, Fig. 3)

Synonyms: *Androniscus africanus* Arcangeli, 1939; *A. alpinus* Verhoeff, 1908; *A. carli* Strouhal, 1929; *A. weberi* Verhoeff, 1908; *Itea dentigera* (Verhoeff, 1908); *Stenasellus hazeltoni* (Collinge, 1946); *Trichoniscus dentiger* (Verhoeff, 1908), *Androniscus dentiger croaticus* Strouhal, 1939

- Distribution: Europe and North Africa, often synanthropically, also known from greenhouses in North America (SCHMALFUSS, 2003)
- Type locality: Santa Margherita, Liguria; Massa; Carrara and Forno, Tuscany, Italy [...westlich der Apenninen bei S. Margherita... bei Massa und Carrara, oberhalb Massa ... bei Forno in den apuanischen Bergen (VERHOEFF, 1908)]
- Ecological status: Endogean to troglophilic species (VANDEL, 1960b)
- Note: According to VANDEL (1960a) and examined specimens from its type locality, the subspecies *A. d. croaticus* Strouhal, 1939 is a junior synonym of *A. d. dentiger*.

MISIDENTIFICATION			
Medvjeđa špilja (cave), Rt. Lokvica, Sv. Jakov, Lošinj**	VK53	NL	JALŽIĆ, 2007

*According to STROUHAL (1939a) only two female specimens were available for the identification of the species. All examined material from the area of Gorski kotar belongs to other species, not yet described, therefore STROUHAL's record might be a misidentification.

**Re-examination of this material shows that the specimens belong to another, not yet described species.

¹ *Alpioniscus* sp.

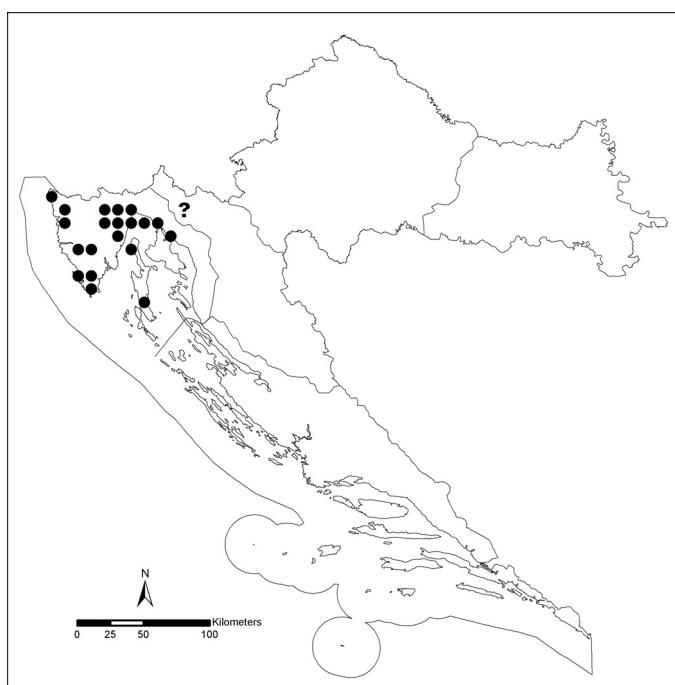

Fig. 16. Croatian distribution of *Alpioniscus strasseri*.

20. *Alpioniscus trogirensis* Buturović, 1955 (Tab. 21, Fig. 17)

- Distribution: Croatia: Dalmatia, Trogira (probably Trogir) (SCHMALFUSS, 2003)
- Type locality: Špilja Sv. Filipa i Jakoba (cave), Marina and Špilja od Bilosoja (cave), St Anthony's Monastery, Trogir, Dalmatia, Croatia [Grotte près de la ville Trogir (Dalmatie) (BUTUROVIĆ, 1955a)*]
- Ecological status: Troglobiotic (BUTUROVIĆ, 1957)

Tab. 21. List of recorded localities for *Alpioniscus trogirensis*

* According to HADŽI (1933) the material collected in 1924 by Stanko Karaman, labeled as »pećina u neposrednoj blizini Trogira« (Grotte près de la ville Trogir, Cave near Trogir) is from one of two caves: Špilja Sv. Filipa i Jakoba and Špilja od Bilosoja

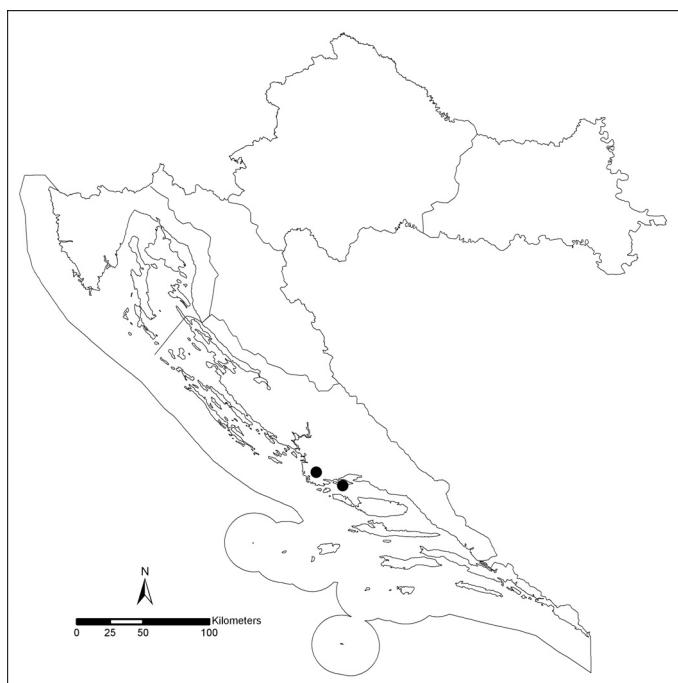

Fig. 17. Distribution of *Alpioniscus trogirensis*.

21. *Alpioniscus verhoeffi* (Strouhal, 1938) (Tab. 22, Fig. 18)

- Synonyms: *Illyrionethes verhoeffi* (Strouhal, 1938)
 Distribution: Croatia or Herzegovina (STROUHAL, 1938); Bosnia (SCHMALFUSS, 2003) is probably a misinterpreted datum.
 Type locality: Špilja u dolini Neretve (cave), Dalmatia, Croatia or Bosnia and Herzegovina, [Narenta Grotten, Dalmatién (STROUHAL, 1938)]
 Ecological status: Troglobiotic (STROUHAL, 1940a; BUTUROVIĆ, 1957)

*It is probably one of the following caves, Donja Baraćevo špilja or Gornja Baraćevo špilja

**The identification is based on one female and two juvenile specimens; considering the distribution of *Titanethes* spp. this is probably a misidentification.

***This locality is on the Croatian-Slovenian border

****Misidentification (conclusion based according to the distribution of the genera *Titanethes* and *Alpioniscus*). The material is not available for the identification of the species.

30. *Cyphoniscellus herzegowinensis* (Verhoeff, 1900) (Tab. 31, Fig. 26)

- Synonyms: *Cyphoniscus herzegowinensis* Verhoeff, 1900
 Distribution: Herzegovina (SCHMALFUSS, 2003); Croatia (POTOČNIK, 1989)
 Type locality: Vučja pećina (cave), Trebinje, Bosnia and Herzegovina [Wolfshöhle bei Trebinje (VERHOEFF, 1900)]
 Ecological status: Troglophilic (STROUHAL, 1940a; BUTUROVIĆ, 1957)
 All known localities are subterranean, and the species is often found deep in caves, so this species is most probably troglobiotic.

Tab. 31. List of recorded localities for *Cyphoniscellus herzegowinensis*

TRICHONISCIDAE: BUDDELUNDIELLINEAE

31. *Buddelundiella cataractae* Verhoeff, 1930 (Tab. 32, Fig. 27)

Distribution: Europe (SCHMALFUSS, 2003)

Type locality: Krka (river, between waterfalls), Skradin, Dalmatia, Croatia [zwischen den Kerkawasserfällen Mitteldalmatiens oberhalb Skardona (VERHOEFF, 1930)]

Ecological status: Widespread species, already recorded in caves in Liguria (VANDEL, 1960b) and in Sicily (CARUSO & BRISOLESE, 1974), common in caves in Croatia, thus we consider it a troglophilic species.

Tab. 32. List of recorded localities for *Buddelundiella cataractae*

DISCUSSION

The karst area in Croatia covers approximately 46% of the national territory (GOTTSTEIN MATOČEC *et al.*, 2002). More than 9000 caves have been registered in Croatia (BAKŠIĆ & NOVOSEL), but literature data concerning subterranean terrestrial isopods include only 221 caves (~2,5 %) and 14 various localities (mines, endogean and epigean environment). Altogether, with the new records from collections, this paper presents data from 557 caves (~6,2 %), six artificial underground structures and 15 other epigean and subterranean localities (endogean, soil, etc.). Probably some localities from the collections are already present in the literature, but the old names are in some cases impossible to be referred to names of localities known at present.

Altogether 765 different records (one locality with one species) were gathered. Among them 275 records (~35,9 %) come from literature data, 601 (~78,6 %) from collection data, and 112 (~14,6 %) from both literature and collection data.

Thirty-five species and five subspecies of the cave-dwelling Oniscidea have been recorded. They are divided into five families and six subfamilies. The family Trichoniscidae and the subfamily Trichoniscinae are the most representative and include 13 (59 %) out of 22 Croatian endemic taxa, and 17 (85 %) out of 20 troglobiotic species (Tab. 42). The most represented genus is *Alpioniscus* with 10 species, followed by *Androniscus* with eight taxa (Fig. 37). Out of 26 cave species described in Croatia, 16

(~62 %) were described in the thirties of the last century, which was the result of intensive sampling done mostly in Dalmatia (Fig. 38).

Tab. 42. Number of genera, species, subspecies, endemic, troglobiotic and troglophilic taxa in different families and subfamilies

Family/Subfamily	Genera	Spp. (sspp.)	Endemic spp. (sspp.)	Troglobiotic spp. (sspp.)	Troglophilic spp. (sspp.)

• Buddelundiellinae	1	1	0	0	1
• Thaumatoniscellinae	1	1	1	1	0
Philosciidae	1	1	0	0	1
Oniscidae	1	3	3	0	3
Armadillidiidae	3	4	2	2	2
• Eluminae	1	2	1	0	2
• Armadillidiinae	2	2	1	0	2
Total	18	35 (5)	17 (5)	19 (1)	16 (4)

Only 165 (~20,3 %) out of 814 Croatian 10 x 10 km UTM squares have one or more cave species. However, plots with at least one cave species are more or less scattered all over the Dinaric region in Croatia. The UTM square VL41 belonging to the Northern Croatian Littoral macroregion has the maximum number of species (six),

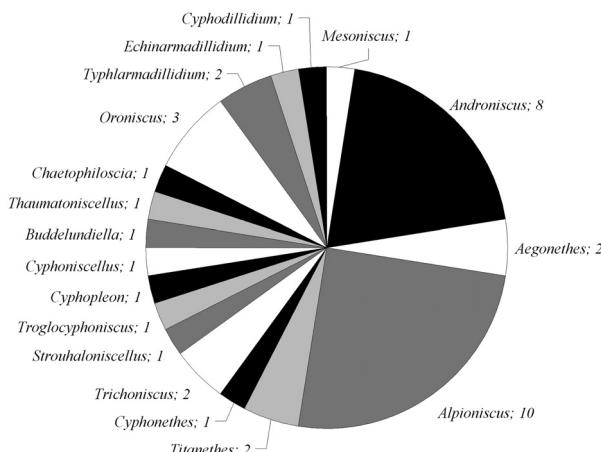

Fig. 37. Frequency distribution of genera of cave-dwelling terrestrial isopods in Croatia. Numbers refer to taxa in each genus.

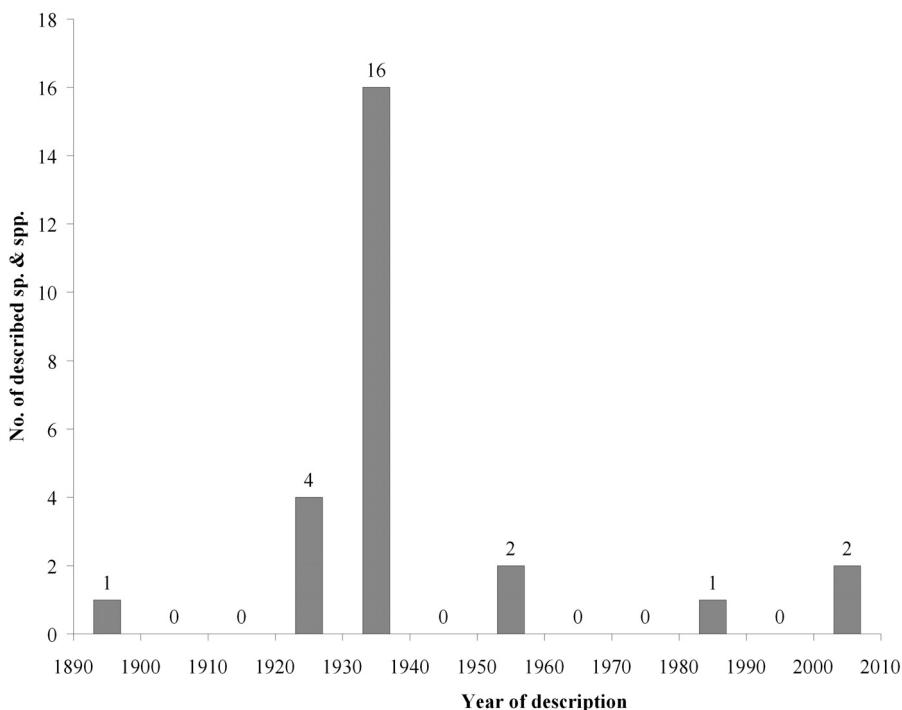

Fig. 38. Comparison of the number of cave species and subspecies described in Croatia from 1890 to present.

followed by plots BN 62, BN71, XH66, XH69 and YH03 belonging to the Southern Croatian Littoral macroregion with five species (Fig. 39). The islands of Mljet and Korčula, mountains of Biokovo and Učka, surroundings of the town of Dubrovnik, and the town of Ogulin are biodiversity hot spots of cave-dwelling terrestrial isopods in Croatia. The present situation might be changed when intensive investigations are carried out in still poorly explored karstic regions like Mt. Velebit.

The Southern Croatian Littoral and the Northern Croatian Littoral macroregions have many more species than the other Croatian macroregions. Out of 40 cave-dwelling taxa in Croatia the Southern Croatian Littoral macroregion has 27 (67,5 %) and the Northern Croatian Littoral macroregion has 15 (37,5 %) (Fig. 40).

The Southern Croatian Littoral macroregion has 16 (~72,7 %) out of 22 endemic cave taxa in Croatia, and among them, two are widespread and 14 are endemic to that region. Cavernicolous terrestrial isopods are recorded from nine Croatian islands on a total of 79 islands and 523 islets. Eight species are endemic to a single island and occur on five islands. All the 40 cave-dwelling taxa in Croatia are distributed in the Dinaric karst area, and only three troglophilic species are also found outside that area (*Androniscus dentiger*, *A. roseus* and *Mesoniscus graniger*). There are no endemic taxa outside the Dinaric karst area (Fig. 41).

Distribution areas of the different species are unequal. Some troglophilic species are widespread, such as *Mesoniscus graniger* in Slovenia, Croatia, Serbia, Bosnia and

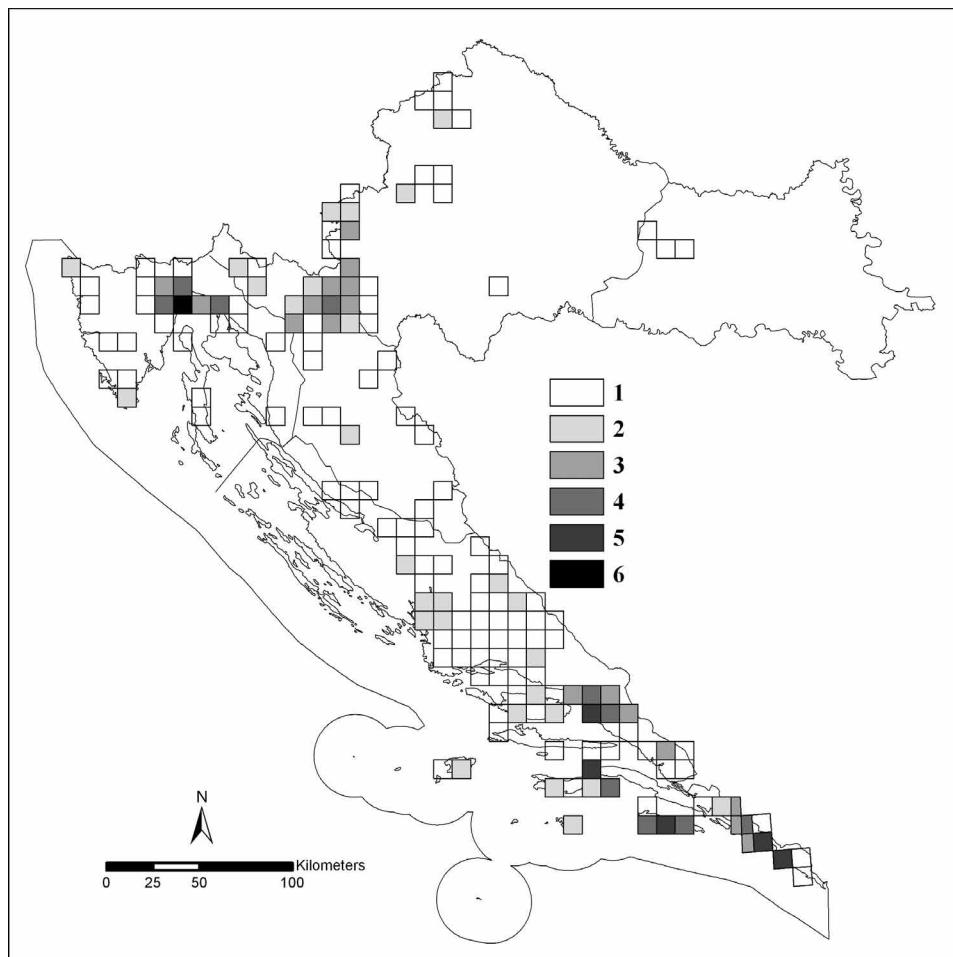

Fig. 39. 10×10 km UTM grid with numbers of species and subspecies of cave-dwelling terrestrial isopods in each square.

Herzegovina, Slovakia, Romania; *Androniscus roseus* from eastern France to Romania; *Chaetophiloscia cellaria* in the northern Mediterranean region; *Trichoniscus matulici* in southern Italy including Sicily, Slovenia, Croatia, Bosnia and Herzegovina and Montenegro. Some species are probably spread synanthropically such as *Buddelundiella cataractae* in Europe; *Androniscus dentiger* in Europe and North Africa, and in greenhouses in North America. The troglobiotic species *Aegonethes cervinus* is distributed across the Adriatic Sea in Italy (Gargano) and Croatia (Dubrovnik, the islands of Korčula and Mljet). In Croatia 23 species (out of 35) are distributed only in single macroregion. The most widely distributed taxa in Croatia are the troglophilic species *Mesoniscus graniger* and *Androniscus roseus* and the troglobiotic species *A. stygius*, found in three macroregions. Only four troglobiotic species (*Alpio-*

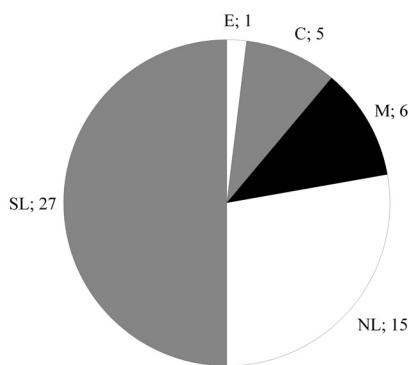

Fig. 40. Frequency distribution of species and subspecies present in Croatian macroregions. Numbers refer to taxa present in each macroregion – E (Eastern Croatia); C (Central Croatia); M (Mountainous Croatia); NL (northern Croatian Littoral); SL (Southern Croatian Littoral)

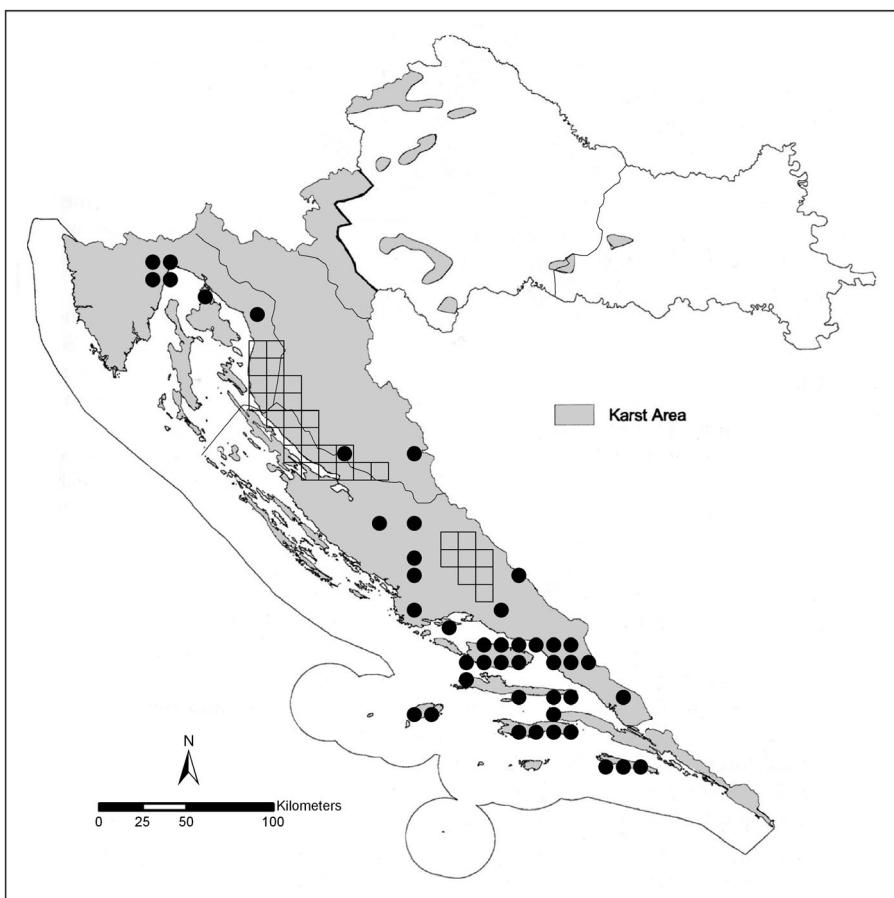

Fig. 41. Distribution of Croatian endemic taxa.

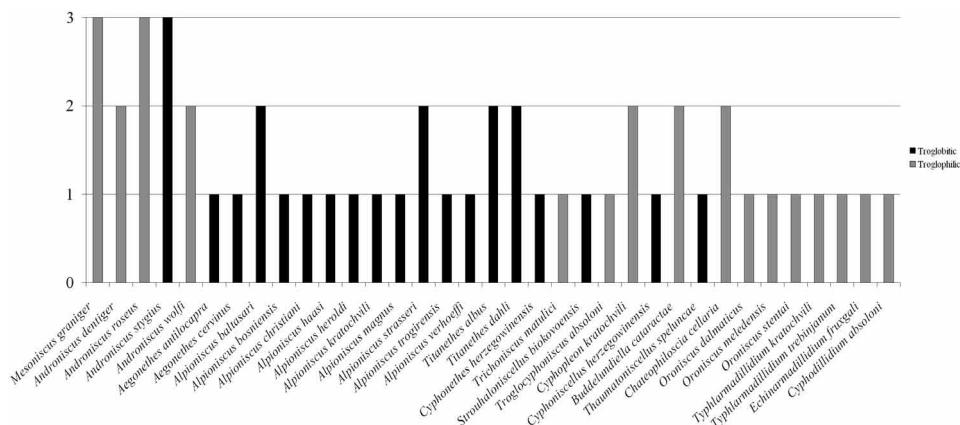

Fig. 42. Comparison of terrestrial isopod species inhabiting various number of Croatian macroregions with indicated ecological adaptation to the cave environment.

niscus balthasari, *A. strasseri*, *Titanethes albus* and *T. dahli*) are distributed in two macroregions, the rest are distributed only in a single macroregion (Fig. 42).

Recent data (published after 2005 or in this paper) have revealed new insights into several species. Although the species *Mesoniscus graniger* is not listed in some reviews (KARAMAN, 1966; POTOČNIK, 1989; SCHMALFUSS, 2003) there are old literature data for Croatia (ARCANGELI, 1939a). This record is from Istria, but in recent investigations in that region the species was not found, either in caves or in endogean habitats. *Mesoniscus graniger* was instead found on Mt. Medvednica, Mt. Ivanščica, Mt. Papuk, the Banovina region and near Karlovac. Only the last locality is part of the Dinaric region (BEDEK, 2007b) (Tab. 1; Fig. 2). *Mesoniscus graniger* is one of the few cave isopods found in Croatia outside the Dinaric region.

The only known record in the literature for *Alpioniscus heroldi* is Benetina pećina near Slano (STROUHAL, 1939a). This cave is probably in Popovo polje in Herzegovina, near Slano, so there is no confirmed literature record of *A. heroldi* in Croatia. However, during recent investigations this species was found in several Croatian caves (Tab. 16; Fig. 13).

Alpioniscus herzegovinensis was recorded from the cave system Lukina jama – Trojama, Hajdučki kukovi, Mt. Velebit, Krasno (KEROVEC et al., 1999). All collected material of the genus *Alpioniscus* from Lukina jama – Trojama and other deep pits in northern Mt. Velebit belong to other species, close to the *strasseri*-group (unpublished data). The species *A. herzegovinensis* is endemic for the Šuma region in SW Herzegovina, where microclimate conditions in caves are totally different from those of the deep pits of northern Mt. Velebit where air temperature in deep pits is more than 10°C lower, so this is probably a misidentification (Tab. 17).

The only known literature data for the species *Alpioniscus verhoeffi* is Špilja u dolini Neretve, Neretva, Dalmatia (STROUHAL, 1938) which can be in Dalmatia or Herzegovina, and Bosnia is probably a misinterpreted datum (SCHMALFUSS, 2003). This species has been collected in several caves near Neretva River and, very surprisingly, also in Špilja na Vršinoj glavici, Stražbenica, Otok, Sinj (Tab. 22; Fig. 18).

The new records resulted in a better understanding of the distribution pattern of several species listed in Croatia. For the species *Alpioniscus balthasari*, the limits of its distribution were extended by 100 km (Tab. 12, Fig. 9). *Androniscus wolfi* was found in the south part of Mt. Velebit (93 km from the only other known locality) (Tab. 9, Fig. 6), *Titanethes dahli* on Mt. Velebit (Tab. 24, Fig. 20), *Trichoniscus matulici metkovicensis* on Mt. Biokovo (Tab. 27, Fig. 22), *Buddelundiella cataractae* in the Dubrovnik and Rijeka regions (Tab. 32, Fig. 27), *Echinarmadillidium fruxgalii* and *Aegonethes cervinus* on the island of Lastovo (Tab. 40, Fig. 35; Tab. 11, Fig. 8), *Cyphoniscellus herzegowinensis* on the island of Korčula (Tab. 31, Fig. 26) and *Troglocyphoniscus absoloni* on Mt. Biokovo and the island of Korčula (Tab. 29, Fig. 24).

Some species cited in the literature have not been confirmed by recent, often repeated explorations in those caves such as, *Oroniscus meledensis* from the island of Mljet, and *Typhlarmadillidium kratochvili* from the island of Korčula.

In this paper only part of the CBSS collection is listed. It contains also many currently unidentified and several new species which will be treated in future papers. Moreover, members of the Croatian Biospeleological Society are still collecting material through numerous projects. Many oniscidean genera need to be revised, and many species to be redescribed. The state of understanding about cave terrestrial isopods in Croatia will probably be modified as a result of a necessary extensive taxonomic work.

ACKNOWLEDGEMENTS

Many acknowledgements to project leaders (in brackets) and financiers. Partially supported by: Ministry of Environmental Protection and Physical Planning (Branko Jalžić), Žumberak – Samoborsko gorje Nature Park (Roman Ozimec), Biokovo Nature Park (Roman Ozimec), the town of Dubrovnik (Marijana Franičević, today Cukrov), Rufford Small Grants for Nature Conservation (Jana Bedek), World Bank (Nikola Tvrtković), Netherlands Government (Nikola Tvrtković), Medvednica Nature Park (Roman Ozimec), Dubrovnik – Neretva County (Roman Ozimec), Dubrovnik Airport (Tihomir Kovačević, Roman Ozimec), the town of Crikvenica (Branko Jalžić), Krka National Park (Branko Jalžić, Kazimir Miculinić), Papuk Nature Park (Jana Bedek), Učka Nature Park (Jana Bedek), Mljet National Park (Helena Bilandžija, Ana Komercić), Ministry of Culture (Helena Bilandžija), Kostrena Municipality Tourist Office (Marko Lukić, Ana Komercić), State Institute for Nature Protection (Branko Jalžić, Roman Ozimec, Marko Lukić), Varaždin County (Roman Ozimec), Sisak – Moslavina County (Roman Ozimec), Croatian Electricity Company (Jana Bedek), European Union (Krunoslav Mlačak, Ljiljana Dravec), Croatian Natural History Museum (Vedran Jalžić), Velebit Nature Park (Jana Bedek).

We thank Marko Lukić for assistance in all stages of this work and for reviewing the manuscript, Roman Ozimec who collected most of the literature and helped with useful information, Branko Jalžić who helped with identifying the majority of localities from old literature and with other useful information. Dr Helmut Schmalfuss, Dr. Ferenc Vilisics, Dr Ivo Karaman, Darija Čaleta, Ivan Glavaš are particularly to be thanked for their help in collecting the missing literature. We are grateful to Slavko Polak, Dr. Fabio Stoch and Dr. Fulvio Gasparo for helping with names of

caves and localities, Dr Ivo Karaman for reviewing the manuscript, Hrvoje Cvitanović for correcting the names of caves, Ana Komerički and Graham McMaster for improving the English, and to the anonymous referees for valuable comments and suggestions.

We would like to thank all collectors of the material (by alphabetical order): Robert Baković, Marko Bašić, Helena Bilandžija, Igor Boršić, Petra Bregović, Ivan Budinski, Stipe Bušelić, Marijana Cukrov (Franičević), Hrvoje Cvitanović, Tamara Čuković, Andela Ćukušić, Ester Domina, Tvrko Dražina, Marina Drčelić, Aljoša Duplić, Lana Đud, Dajana Hmura, Ivica Jaklinović, Vatroslav Jakobović, Branko Jalžić, Vedran Jalžić, Lucija Janković-Rapan, Luka Katušić, Fanica Kljaković Gašpić, Marina Kipson, Alen Kirin, Ana Kolarić, Tommy Kolman, Ana Komerički, Petra Kovač Konrad, Ivana Kovačić, Marko Lukić, Marta Malenica, Marin Manger, Neven Matočec, Kazimir Miculinić, Barbara Mikac, Saša Minihofner, Gorana Miščenić, Krešimir Motočić, Dr Jos Notenboom, Mislav Novokmet, Darijan Ozimec, Margita Ozimec, Roman Ozimec, Goran Palijan, Martina Pavlek, Slavko Polak, Gordan Polić, Predrag Rade, Tonći Rađa, Maja Rađenović, Nikolina Raguž, Ilija Rašić, Tomica Rubinić, Dr Rajko Slapnik, S. Šore, Matija Vojnović, Milan Vojinović, Davorin Vraneković, Snježana Vujičić-Karlo, Roko Žaja and Dijana Župan.

And last but not least we thank all speleologists and colleagues from SO PDS Velebit, SO HPD Željezničar, DDSKF, SK Samobor, SK Ursus spelaeus, SU Estavela, SU Spelunka, SO PD Dubovac, SD Karlovac and the Biological Students Society BIUS who organised and co-financed the different speleological camps.

Catalogue and atlas of cave-dwelling terrestrial isopods (Crustacea: Oniscidea) from Croatia

J. Bedek, S. Taiti & S. Gottstein

In Croatia 130 species and 30 subspecies of terrestrial isopods have been recorded, 59 species and 17 subspecies of which are endemic to Croatia. Altogether, this paper presents data from 557 caves, 6 artificial underground structures and 15 other epigean and subterranean localities. Among the cave taxa, 35 species and five subspecies have been recorded. The family Trichoniscidae and the subfamily Trichoniscinae are the most abundant (13 (59%) out of 22 Croatian endemic taxa and 17 (85 %) out of 20 troglobiotic taxa). The genus most represented is *Alpioniscus* with 10 species. Only 165 out of 814 Croatian 10 × 10 km UTM squares (~20,3 %) have one or more cave species. The UTM square VL41 presents the maximum with six species, belonging to the Northern Croatian Littoral macroregion. The UTM squares BN62, BN71, XH66, XH69 and YH03 have five species, belonging to the Southern Croatian Littoral macroregion. The Southern Croatian Littoral macroregion has 27 (67,5 %) out of 40 cave taxa in Croatia, and the Northern Croatian Littoral macroregion has 15 (37,5 %). The Southern Croatian Littoral mesoregion has 16 (~72,7 %) out of 22 endemic cave taxa in Croatia and among them, two are widespread and 14 are endemic to that region. Five islands have their own endemic species (eight species). The most widely distributed species in Croatia are the troglophiles *Mesoniscus graniger*, *Androniscus roseus*, and the troglobiont *A. stygius* found in three macroregions. Only four troglobiotic species (*Alpioniscus balthasari*, *A. strasseri*, *Titanethes albus* and *T. dahli*) are distributed in two macroregions, the remaining species are distributed only in single macroregions. All the 40 cave-dwelling taxa in Croatia are distributed in the Dinaric karst area, and only three troglophilic species are found also outside this area. No endemic taxa occur outside the Dinaric karst area. In this paper only part of the CBSS collection is listed. The majority of genera need to be revised and many species redescribed. The knowledge about cave terrestrial isopods in Croatia will probably be modified as a result of an extensive taxonomic work which still needs to be done.

APPENDIX 1.

Tab. 43. List of synonyms for locality records of cave-dwelling terrestrial isopods in Croatia with references associated with the recorded locality name.

Recorded locality name	Present locality name
Baba pećina (BUTUROVIĆ, 1955c, KARAMAN, 1966)	Baba špilja
Balićeva pećina (STROUHAL, 1939a)	Balićeva špilja
Balićeva pećina (GIROMETTA, 1913, GIROMETTA, 1914, LANGHOFFER, 1915a, STROUHAL, 1939b, KARAMAN, 1966)	Balićeva špilja
Baračeva II (STROUHAL, 1939b)	Gornja Baračeva špilja
Baračeva Pećina (STROUHAL, 1939b)	Baračeva špilja
Baračeva Pećina I (STROUHAL, 1939b)	Donja Baračeva špilja
Baračeva pećina II (LANGHOFFER, 1915a)	Gornja Baračeva špilja
Baračeva špilja Mala (OZIMEC, 2003)	Donja Baračeva špilja
Baračeva špilja Velika (OZIMEC, 2003)	Gornja Baračeva špilja
Bardarovica (FRANKENBERGER, 1938a, KARAMAN, 1966)	Špilja na Bardarovici
Barićevića pećina (KARAMAN, 1966)	Barićevića pećina
Barilović Špilja (STROUHAL, 1939b)	Vražića špilja
Bazdovača (STROUHAL, 1939a, BEDEK et al., 2006)	Bazgovača jama
Bazgova jama (BEDEK et al., 2006)	Bazgovača jama
BB Nr. 6 (misprint, should be BB Nr. 661) (JALŽIĆ et al., 2010)	Movrica

Vindia špilja (STROUHAL, 1939d, KARAMAN, 1966)	Vindija
Viteziceva pecina (GOTTSTEIN <i>et al.</i> , 2001)	Biserujka
Vitezičeva pećina (POTOČNIK, 1983, BEDEK <i>et al.</i> , 2006)	Biserujka
Vitezičova jama (BEDEK <i>et al.</i> , 2006)	Biserujka
Viteziča špilja (BEDEK <i>et al.</i> , 2006)	Biserujka
Viteziceva pećina (GOTTSTEIN MATOČEC <i>et al.</i> , 2002)	Biserujka
Vlaška pecina (ARCANGELI, 1940, GOTTSTEIN <i>et al.</i> , 2001)	Vlaška peć
Vlaška Pećina bei Zengg zwischen Kozica und Smokvica (BEDEK <i>et al.</i> , 2006)	Vlaška peć
Vlaška pećina (STROUHAL, 1939d, KARAMAN, 1966, VUJČIĆ-KARLO & RAĐA, 2004, BEDEK <i>et al.</i> , 2006)	Vlaška peć
Vlaška špilja (BEDEK <i>et al.</i> , 2006)	Vlaška peć
Vodenja jama (JURINAC, 1886, LANGHOFFER, 1912, LANGHOFFER, 1915b, CSIKI, 1926, STROUHAL, 1939b)	Ambarac
Vražić-pećina (LANGHOFFER, 1915a)	Vražića špilja
Vrlovkahöhle (STROUHAL, 1939b)	Vrlovka
Zagorje pećina (CSIKI, 1926, STROUHAL, 1939b)	Zagorska peć
Zagorska peć (VUJČIĆ-KARLO & RAĐA, 2004)	Vlaška peć
Zala (JALŽIĆ & BOŽIĆEVIĆ, 1975)	Mikašinovića špilja
Zejava (STROUHAL, 1939a, KARAMAN, 1966)	Žejava
Zrinski rudnici (BEDEK, 2007b)	Rudnik Zrinski

APPENDIX 2.

Tab. 44. Collection records

Croatian Biospeleological Society (CBSS) collection	
CBSS collection 1	M. Lukić, 05.12.2008.
CBSS collection 2	J. Bedek, 24.01.2004.
CBSS collection 3	H. Bilandžija, 04.12.2004.
CBSS collection 4	R. Ozimec, 04.12.1994.; 29.10.2000.; J. Bedek, I. Boršić, R. Ozimec, 14.07.2001.; I. Boršić, 07.10.2001.; M. Lukić, 23.02.2003.; R. Ozimec, 26.02.2003.; M. Lukić, 21.04.2003.; 15.06.2003.; 07.11.2003.; J. Bedek, M. Lukić, 12.11.2003.; M. Lukić, R. Ozimec, 28.12.2003.; M. Pavlek, 13.05.2004.; J. Bedek, 04.12.2004.; M. Lukić, 22.12.2004.; J. Bedek, 16.01.2005.; H. Bilandžija, 26.02.2005.; R. Ozimec, 04.11.2006.
CBSS collection 5	J. Bedek, 16.04.2005.
CBSS collection 6	J. Bedek, 22.05.2005.
CBSS collection 7	H. Bilandžija, 14.06.2004.
CBSS collection 8	H. Bilandžija, 20.03.2005.
CBSS collection 9	R. Ozimec, 11.05.2008.
CBSS collection 10	R. Ozimec, P. Rade, 27.02.2009.
CBSS collection 11	J. Bedek, 18.07.2004.
CBSS collection 12	H. Cvitanović, 20.04.2006.
CBSS collection 13	P. Rade, 20.04.2006.
CBSS collection 14	M. Pavlek, 23.04.2006.
CBSS collection 15	M. Lukić, 27.10.2008.
CBSS collection 16	M. Lukić, 25.10.2008.
CBSS collection 17	M. Pavlek, 21.04.2006.; R. Ozimec, H. Cvitanović, 25.10.2008.
CBSS collection 18	M. Lukić, 23.09.2010.
CBSS collection 19	A. Komerički, 22.09.2010.
CBSS collection 20	L. Katušić, 13.05.2006.
CBSS collection 21	R. Ozimec, M. Pavlek, 27.05.2007.; J. Bedek, 0.11.2007.; F. Kljaković Gašpić, 13.05.2008.
CBSS collection 22	R. Ozimec, 27.05.2007.
CBSS collection 23	F. Kljaković Gašpić, R. Ozimec, P. Rade, 28.05.2007.
CBSS collection 24	R. Ozimec, 16.05.2006., 13.10.2006.; H. Cvitanović, R. Ozimec, 16.10.2006.; R. Ozimec, 04.11.2007.
CBSS collection 25	H. Bilandžija, L. Katušić, R. Ozimec, M. Pavlek, 14.05.2006.; P. Bregović, L. Katušić, A. Kolarić, P. Rade, 15.10.2006.
CBSS collection 26	H. Cvitanović, 03.05.2006.; H. Cvitanović, R. Ozimec, 14.10.2006.
