

## EDITORIAL

This issue of *Zbornik radova* introduces several changes to the journal. First, from this issue on, the journal will be published solely in English. The Croatian title *Zbornik radova*, however, has been retained for continuity, and the subtitle *Journal of Information and Organizational Sciences* has been added to indicate that its scope lies mainly within these areas, although articles from related fields will also continue to be published. Second, the title page of the journal has been redesigned and some minor changes to the matter on the front cover have been made. Finally, the layout of the articles has been modified, to make it conform more closely to the prevailing practice followed by similar journals published in English.

This issue of the journal contains seven papers that range over a variety of topics. M. Maleković discusses agent properties relating to reasoning about knowledge, M. Čubrilo examines the possibility of mapping the structure of classical information sources into the hypertext structure, and G. Bubaš and B. Aurer deal with the non-technical competencies required for information technology professionals. The article by I. Lončar, which is concerned with a specialized mathematical topic, tries to prove some theorems concerning non-metric hereditarily locally connected continua, while the paper written by L. Miko focuses on accounting management information and its use in strategic decision making. Finally, M. Varga provides an overview of data interchange standards and M. Čubrilo et al. report on a multimedia project jointly carried out by the Karl-Franzens Universität in Graz and the Faculty of Organization and Informatics in Varaždin. We hope these articles will be of interest to our readership.

The journal's main aim will continue to be a high standard of published work, expeditious refereeing and timely publication of accepted contributions.
