MILLER-RABIN (n, t)

INPUT :an odd integer $n \geq 3$ and security parameter $t \geq 1$

OUTPUT :answer "prime" or "composite" to the question :

"Is n prime?"

1. Write $n - 1 = 2^s r$ such that r is odd
2. For i from 1 to t do the following:
 - 2.1. Choose a random integer a , $2 \leq a \leq n - 2$
 - 2.2. Compute $y = a^r \pmod{n}$
 - 2.3. If $y \neq 1$ and $y \neq n - 1$ then do the following:

$y \leftarrow 1$

While $j \leq s - 1$ and $y \neq n - 1$ do the following:

Compute $y \leftarrow y^2 \pmod{n}$

If $y = 1$ then return ("composite")

$j \leftarrow j + 1$

If $y \neq n - 1$ then return ("composite")
3. Return ("prime")

2.2 (RSA)

SUMMARY: each entity creates an RSA public key and a corresponding private key

Each entity A should do the following:

1. Generate two large random (and distinct) primes p and q , each roughly the same size.
2. Compute $n = pq$ and $\phi = (p - 1)(q - 1)$
3. Select a random integer e , $1 < e < \phi$ such that

$$\gcd(e, \phi) = 1$$
4. Compute the unique integer d , $1 < d < \phi$, such that

$$ed \equiv 1 \pmod{\phi}$$
5. A's public key is (n, e) ; A's private key is d .

$n = pq$ 가 1
 p, q 가 . p, q 가 가
 n 가

===== 2.3 (RSA) =====

SUMMARY: B encrypts a message m for A, which A decrypts

1. Encryption: B should do the following:

- (a) Obtain A's authentic public key (n, e)
- (b) Represent the message as an integer m in the interval $[0, n - 1]$
- (c) Compute $c = m^e \pmod{n}$
- (d) Send the ciphertext c to A

2. Decryption: To recover plaintext m from c ,

A should do the following:

- (a) Use the private key d to recover $m = c^d \pmod{n}$

===== $ed \equiv 1 \pmod{\phi}$ $ed = 1 + k\phi$

ABSTRACT

Cryptography has originated from its initial and limited use by the Egyptians about 4000 years ago. It has explosively developed through both world wars. The most striking development came in 1976 when Diffie and Hellman introduced the revolutionary concept of public-key cryptography although their method was impractical. In 1978, the first practical public-key cryptosystem was discovered by Rivest, Shamir, and Adleman, now referred to as RSA. RSA scheme is the most widely used system and its security is based on a hard mathematical problem, the intractability of factoring large integers.

In this paper, we introduce the general symmetric and public key cryptosystems and mainly, we attempt an effective realization of RSA cryptosystem using C++ language.
