Abstract

The paper will give an overview of developments in Estonia in the field of Human Language Technologies. Despite of the fact that Estonian is one of the smallest official languages in EU and therefore in less favourable position in the HLT-market, the national initiatives are undertaken in order to promote HLT development in Estonia.

1 Introduction

The development efforts of human-computer interaction during the past few decades have been directed towards natural communication using spoken language input and output. For several, especially "big" languages, progress in language technology has been impressive - research results have been successfully exploited in commercial products and services, and the HLT-market shows growing trends. According to the Euromap report (Joscelyne, Lockwood, 2003) on HLT progress in EU countries, the leading positions are held by the UK, Germany, France, the Netherlands and Finland. In the case of the first three countries it can be explained mainly by large market demands, whereas in the latter cases the leading position has been achieved due to several simultaneous factors - healthy environment for R&D, relatively large and strong research community and significant national-level support in the HLT area. Although linguistic and cultural diversity are the core values of the EU and discrimination based on language is prohibited by the EU's charter of fundamental rights (article 22) we need to face the fact that there are primary, secondary and even tertiary languages of

commercial relevance (TC-STAR report, 2006). Development of HLT tools for a new language is a more or less fixed effort and does not correlate with the number of speakers; therefore the smaller languages are in less favourite position, as the costs per capita for HLT development will be higher. What should be done for smaller languages in order to strengthen their market positions and survival in a multilingual EU? - these are crucial questions for smaller countries and also for EU language policy makers wanting to prevent Gutenberg's effect from taking place in the computer age. These issues have been addressed in Krauwer's papers (2005, 2006). Krauwer's claim that the strong industrial bias of EU programmes has led to the situation where the major part of HLT funding is used to support a few major EU languages seems to hold true. As there are not many options (due to the subsidiarity principle) to get financial support from the EU for the technological development of smaller languages, activities on the national level are of great importance. In Estonia several activities to promote R&D in HLT area have been undertaken during the last decade. Mostly these activities have been initiated by the academic groups working on HLT-related topics; in parallel with academic research a lot of effort has been put into explaining the role of HLT in the information society. Although not all initiatives were fully successful, they played an enlightening role among decision-makers and contributed to the forming of a positive attitude in the society. As a result of the joint effort of researchers and the Ministry of Science and Education, the National Programme for Estonian Language Technology (2006-10) was launched. In this paper we will share our experiences in promoting HLT-related

national activities and introduce the Estonian HLT roadmap as well as on-going R&D projects.

2 HLT research in Estonia

The history of HLT research in Estonia dates back to the 1960s when the first academic groups working on computer linguistics, experimental phonetics and speech analysis were established in Estonia. After 1991, when Estonia re-established its independence, the whole system of research structure in the country was reorganised and new financing schemes were introduced. Most of today's HLT research units have sprung up from these former groups.

There are three key players working in the field of HLT in Estonia:

(1) **University of Tartu**, represented mainly by the **Research Group on Computer Linguistics**

(<http://www.cl.ut.ee>). Their research areas cover:

- formal descriptions of morphology, syntax and semantics of the Estonian;
- creating Estonian language resources: electronic corpora of written and spoken language, dialogue corpora, parallel corpora, lexical and semantic database (thesaurus, Estonian WordNet);- software development for morphological, syntactic and semantic analysis and synthesis.

In addition, two further groups (bioinformatics and phonetics) contribute to HLT field.

(2) **Institute of the Estonian Language, Research Group on Language**

Technology (<http://www.eki.ee>), focused on:

- rule-based morphological systems: formal grammars and software (morphological synthesis and analysis, morphological disambiguation);
- language resources: electronic versions of traditional dictionaries, linguistic databases, text-based dictionaries, lexicons for machine translation, www-applications;
- phonetics and speech technology:

text-to-speech synthesis (TTS) and linguistic problems (modelling of speech prosody, relations between syntax and prosody) and speech databases.

(3) **Institute of Cybernetics at Tallinn**

University of Technology represented by **the Laboratory of Phonetics and Speech Technology**

(<http://www.phon.ioc.ee>). It's R&D activities include:

- experimental phonetics: research on Estonian sound system and prosody including Estonian as L2;
- speech technology: speech analysis and speech synthesis, automatic speech recognition (ASR);
- speech databases: Estonian BABEL, Estonian SpeechDat, etc.

There also exist a few small private HLT companies:

Filosoft (<http://www.filosoft.ee>) - a spin-off company of Tartu University established in 1993, provider of several software products (speller, hyphenator and thesaurus for Estonian, speller and hyphenator for Latvian) and dictionaries for several platforms (MS Windows, Mac OS X, Unix). The company runs the language portal Keeleveeb (<http://www.keeleveeb.ee>) offering free access to different on-line dictionaries, software and corpora.

Keelevara

(<http://www.keelevaara.ee>) was founded in 2004 in order to provide on-line access to several professional electronic dictionaries and lexicons, access to some dictionaries is free.

Tilde Eesti (<http://www.tilde.ee>) is a branch of Latvian company Tilde (<http://www.tilde.lv>), established in 1991. Tilde's products cover localized fonts, Latvian and Lithuanian language support, proofing tools, electronic dictionaries, multimedia products, etc. Tilde Eesti is focused on software localisation and translation services.

TEA Publishers (<http://www.tea.ee>) - established in 1991, one of the leading publishers of economics dictionaries and

foreign language textbooks in Estonia. **Imprimaatur** - founded in 1996, offers consulting, training and quality assurance services related to translation and term banks.

Festart - established in 1995, provider of electronic dictionaries English <-> Estonian, Russian <-> Estonian.

Nekstom - OCR for Estonian, distributor of ABBYY software in Estonia.

2.1 HLT financing

Reforms of research funding in the beginning of the 1990s mark a new era for the academic community in Estonia. A competition-based funding scheme was introduced where all research fields had to compete for survival. HLT research groups survived quite well due to successful participation in several international projects (e.g. EU Copernicus). Starting at the end of the 1990s, additional funding sources were opened: the Estonian Language Technology programme initiated by the Estonian Informatics Centre (1998-2000). Within this programme the first Development Plan for Estonian Language Technology was compiled in 1999;

- the national programmes "Estonian Language and Cultural Heritage" (1999-2003) and "Estonian Language and National Memory" (2004-2008) including sub-programmes for HLT.

HLT key-players were involved also in EU FP5 project "eVikings II: Establishment of the Virtual Centre of Excellence for IST RTD in Estonia" (2002-2005). One important outcome of the project was the Estonian HLT Roadmap for 2004-2011. Within this project also two further applications (for the Estonian Language Technology Competence Centre and for the Centre of Excellence in HLT) were submitted to different funding bodies in 2003. Both applications were not fully successful, but they played an important role in paving the way to the national HLT programme.

3 Estonian HLT Roadmap

The roadmap (Figure 1) compiled in 2004

shows the baseline - the resources and tools developed in Estonia during several years before 2004, and presents the future developments in three major action lines:

Action Line 1: Spoken Language Technology including:

- speech synthesis: creating Estonian TTS software and development of an audio-visual synthesis prototype;

- speech recognition: creating a prototype of limited vocabulary ASR and development of language-specific methods for unlimited vocabulary ASR;

- dialogue systems: creating limited-domain intelligent services capable of replacing routine human work.

Action Line 2: Written Language Technology including:

- language processing methods: formalisms for automated processing of different language levels (morphology, syntax, semantics, pragmatics), modeling and creating of corresponding prototypes;

- machine translation: create methods for translating to and from Estonian, compile multilingual vocabularies and mechanisms of transforming syntactic structures; develop prototype for Estonian <-> English machine translation.

Action Line 3: Language Resources including:

- creating infrastructure for collection and management of different language resources;

- collecting different types of resources: speech and text corpora, and electronic dictionaries.

Comparing the roadmap to the achievements in 2008 we can see good progress in all action lines, nevertheless an update of the roadmap is necessary.

4 Towards national HLT programme

In 2003 the Development Strategy of the Estonian Language 2004-2010 was compiled by the members of the Estonian Language Council and was approved by the Estonian Government on August 5, 2004.

(http://www.eki.ee/keelenoukogu/strat_en.pdf)

The strategy provides a research-based description of the situation of the Estonian

language, the objectives that need to be achieved, the necessary steps and institutions and people involved. The development plan of the Estonian language covers all the major areas of language use including language technology.

4.1 National Programme for Estonian Language Technology (NPELT)

NPELT

(<http://www.keeletehnoloogia.ee>) was compiled in 2005 by a group of HLT experts and launched by the Ministry of Science and Education in 2006 for a period of five years (2006-2010).

The main goal of NPELT is to develop technology support for the Estonian language to the level that would allow functioning of Estonian in the modern information society. NPELT is funding HLT-related R&D activities including creation of reusable language resources and development of essential linguistic software (up to the working prototypes) as well as bringing the relevant language technology infrastructure up to date. The resources and prototypes funded by the national programme are declared public.

NPELT management is carried out by a steering committee of 9 members (including HLT experts and representatives of the ministries), and a programme coordinator. Responsibilities of the steering committee include the evaluation of project proposals and progress reports, making funding proposals, purposeful use of public funding, surveying the developments in the HLT field on the national and international scale, etc. General rules adopted by the committee:

- financing of projects based on open competition,
- groups are requested to provide annual progress reports,
- evaluation of projects based on well-established criteria,
- international standards/formats need to be followed,
- access to the developed prototypes and language resources should be free or based

on licence agreements.

Financing of the programme: ca 0.5 M€ per year in 2006 and 2007, ca 1.1 M€ per year for 2008 - 2010, of which about 33% should be used for the creation of language resources, 66% for research and software development, and 1% for the programme management.

On-going projects: In 2009, 23 projects have been funded (2006: 17, 2007: 20, 2008: 23) which cover a wide range of topics (see <http://www.keeletehnoloogia.ee/projektid>):

- speech corpora: emotional speech, spontaneous speech, dialogues, L2 speech, etc;
- text corpora: written language corpus, multi-lingual parallel corpora, etc.
- research/technology development - speech recognition, speech synthesis, machine translation, information retrieval, lexicographic tools, syntactic analysis, semantic analysis, dialogue modelling, variations in speech production and perception, etc.

5 Centre of Excellence in Computer Science

Estonian language technology researchers are also engaged in the Estonian centre of excellence EXCS (Estonian eXcellence in Computer Science) to be financed over the period 2008-2015. The general objective of the centre of excellence, composed of the research staff of Institute of Cybernetics at the Tallinn University of Technology, Cybernetica AS and the University of Tartu and representing a major part of the computer science research conducted in Estonia, is to consolidate and advance computer science in 6 areas of recognized strength: programming languages and systems, information security, software engineering, scientific and engineering computing, bioinformatics and human language technology. The specific objectives are to enhance the research potential of the groups by facilitating collaboration, to increase the impact of their research results on academia and industry-society as well as to popularize them, and to ensure the sustainability of the groups. This will be achieved by carefully planned

coordination and joint actions, targeted at creating a thriving and highly reputed research environment attractive for young researchers. According to the Estonian R&D strategy “Knowledge –Based Estonia 2007-2013”, ICT are one of the key technologies for the Estonian RD&I.

6 Centre of Estonian language resources

In 2008, a project of setting up the Centre of Estonian language resources at the University of Tartu was started in the overall framework of the national programme “Estonian Language Technology”.

The natural language resources can be used by different end-users only if the existing resources are well-documented, archived and publicly accessible. In order to support such activities which sometimes may seem gratuitous from the point of view of language resource creators, there need to be a fixed infrastructure to manage and coordinate these activities in Estonia, starting from elaborating the corresponding language technology standards up to drawing the contracts/licence agreements necessary for the use of these language resources.

To achieve this goal, an ESFRI project CLARIN (Common Language Resources and Technology Infrastructure, <http://www.clarin.eu>) has been launched. The University of Tartu is the official representative of Estonia among the 31 partners of CLARIN. The participation in the CLARIN network provides a unique opportunity to involve the pan-European experience in solving our problems.

A similar project titled “Language Technology Documentation Centre” (<http://www.nordoknet.org/>) started in the Nordic countries in 2002 under the auspices of the Nordic Council of Ministries. That Centre has been instrumental in creating a network of centres in Finland, Sweden, Denmark, Iceland and Norway.

The Centre of Estonian language resources will do utmost that the existing language resources will not remain only at the disposal of the creators of these resources but will ultimately reach all the interested

parties, e.g. linguists, teachers, creators of software systems and their applications, civil servants, etc.

7 Conclusions and future prospects

The national programme has created favourable conditions for HLT development in Estonia. Obviously not all HLT fields are equally addressed and it would be naive to expect that all essential prototypes and resources will be created within a short period. The steering committee is planning an update of the HLT roadmap and takes the initiative towards defining a BLARK (Basic Language Resource Kit) for Estonian.
