## Sodium pentafluorophenylborate

Hannes Vitze, Hans-Wolfram Lerner and Michael Bolte\*

Institut für Anorganische Chemie, J. W. Goethe-Universität Frankfurt, Max-von-Laue-Str. 7, 60438 Frankfurt/Main, Germany

Correspondence e-mail: [bolte@chemie.uni-frankfurt.de](mailto:bolte@chemie.uni-frankfurt.de)

Received 10 October 2012; accepted 11 October 2012

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.010$  Å;  $R$  factor = 0.058;  $wR$  factor = 0.138; data-to-parameter ratio = 6.5.

The crystal structure of the title compound,  $\text{Na}[(\text{C}_6\text{F}_5)\text{BH}_3]$ , is composed of discrete anions and cations. The sodium cations are surrounded by four anions with three short  $\text{Na}\cdots\text{B}$  [2.848 (8), 2.842 (7) and 2.868 (8) Å] and two short  $\text{Na}\cdots\text{F}$  contacts [2.348 (5) and 2.392 (5) Å], forming a three-dimensional network. The anion is the first structural example of a pentafluorophenyl ring carrying a  $\text{BH}_3$  group.

### Comment

The hydridoborates  $[(C_6F_5)BH_3]^-$  and  $[(C_6F_5)_2BH_2]^-$  are convenient starting materials for the *in situ* generation of the boranes  $(C_6F_5)BH_2$  and  $(C_6F_5)_2BH$  (Schnurr *et al.*, 2011). In this paper we report the crystal structure of  $Na[(C_6F_5)BH_3]$  which was obtained from the reaction mixture of  $(C_6F_5)B(OMe)_2$  and  $Li[AlH_4]$  by a cation exchange with NaOH (Fig. 1).

The title compound (Fig. 2) is composed of discrete anions and cations. The sodium cations are surrounded by four anions with three short  $Na\cdots B$  [ $Na1\cdots B1$  2.848 (8) Å,  $Na1\cdots B1^i$  2.842 (7) Å,  $Na1\cdots B1^{ii}$  2.868 (8) Å; symmetry operators: (i)  $-x + 2, y - 1/2, -z + 1$ , (ii)  $-x + 1, y - 1/2, -z + 1$ ] and two short  $Na\cdots F$  [ $Na1\cdots F6^{ii}$  2.348 (5) Å,  $Na1\cdots F2^{ii}$  2.392 (5) Å] contacts (Fig. 3).

It is remarkable that this is the first structure with an pentafluorophenyl ring carrying a  $BH_3$  group. A search in the Cambridge Crystallographic Database (CSD, Version 5.33 of November 2011, plus three updates (Allen, (2002). *Acta Cryst.* B58, 380–388) yielded no hit at all for this fragment.

### Experimental

In a round bottom flask  $(C_6F_5)B(OMe)_2$  (0.16 g, 0.65 mmol) was dissolved in 10 ml diethyl ether. Under stirring a 1 M solution of  $Li[AlH_4]$  in diethyl ether (1.2 mmol, 1.1 ml) was added *via* canula. A brown slurry was obtained which was treated with 3 ml aqueous NaOH (3 mmol) and 15 ml benzene. Insoluble material was removed by filtration from the organic layer. Single crystals of the title compound were obtained of the concentrated benzene solution (5 ml). Yield 20%.

### Refinement

Due to the absence of anomalous scatterers, the absolute structure could not be determined and 414 Friedel pairs were merged. H atoms were located in a difference map, but geometrically positioned and refined using a riding model with fixed individual displacement parameters [ $U(H) = 1.5 U_{eq}(B)$ ] and with  $B-H = 0.98$  Å. The  $BH_3$  group was allowed to rotate but not to tip.

### Computing details

Primary atom site location: structure-invariant direct methods	

Special details

Experimental ;

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
