

A contribution to the *Campylopus* flora of Chile

Jan-Peter Frahm

Nees Institut für Biodiversität der Pflanzen, Rheinische Friedrichs-Wilhelms Universität, Meckenheimer Allee 170, D 53115 Bonn, Germany, Frahm@uni-bonn.de

Abstract: A key to the species of *Campylopus* known from Chile is given, completed by records of Campylopodioideae of the author in southern Chile. *Campylopus acuminatus* Mitt. var. *kirkii* (Mitt.) J.-P. Frahm is reported for the first time for Chile.

The first key to the *Campylopus* species of Chile was published by Frahm (1976). It was written to determine collections made by L. Landrum in 1969-71 and was based on an uncritical compilation of all species reported for Chile at that time. It included 33 species. An almost complete revision of the genus during the following twenty years resulted in a drastic reduction of species numbers by new synonyms. This concerns especially the austral regions, where many species have wide subantarctic ranges. Most taxonomic and nomenclatural changes were considered in the recent first checklist of the mosses of Chile by He (1998), with the following exceptions (see also Frahm 1999):

C. areodictyon (C. Müll.) Broth. This species distributed through the northern Andes (Frahm 1991) was reported for the Juan Fernandez Islands by Brotherus (Robinson 1975). Robinson (l.c.) attributed these records to *C. kunkelii* Bartr.,

a species which was regarded as synonymous with *C. pyriformis* (Schultz) Brid. (Corley & Frahm 1982).

C. flavissimus (C. Müll.) Besch. is synonymous with *Chorisodontium fulvatum* Besch. according to Frahm (1987), a species now considered as synonymous with *C. aciphyllum* (Hook. f. & Wils.) Broth. (Hyvönen 1991).

Campylopus hamatus Bartr. is considered to be a species of *Chorisodontium* (Frahm 1999).

C. morenoi Dus. is not a *Campylopus* (Frahm 1999).

In general, most of the *Campylopus* species of Chile are austral in distribution (*C. introflexus*, *incrassatus*, *clavatus*, *acuminatus*, *pyriformis*, *purpureocaulis*, *vesticaulis*, cf. Frahm 1988). Endemic to Chile vz. southern South America

are (at the present state of knowledge) *C. chilensis*, *laxoventralis* and *modestus*. Tropical montane to subtropical is *C. pilifer* Brid. In addition, there are doubtful records of the neotropical *C. richardii* Brid. and the andine *C. asperifolius* Mitt., which are not considered in the following key. Due to the lack of any flora of Chile, a new key for the *Campylopus* species of this country is given here, which may be of help for other bryologists identifying collections from Chile.

Key to the species of *Campylopus* from Chile

- 1 Inner basal laminal cells incrassate, relatively short, 2-3:1, outer ones narrow in 8-10 rows. Upper laminal cells subquadrate. Leaves epilose. Costa in transverse section with ventral hyalocysts and dorsal stereids..... *C. spiralis*
- 1* Inner basal laminal cells thin-walled..... 2
 - 2 Leaves ending in a hyaline hairpoint (which can be reduced in shaded habitats)..... 3
 - 2 Leaves without hairpoints..... 12
 - 3 Hairpoints reflexed or recurved..... 4
 - 3* Hairpoints straight..... 7
 - 4 Hairpoints reflexed..... *C. introflexus*
 - 4* Hairpoints recurved, if reduced, costa very wide, filling 2/3-3/4 of leaf width, widest above leaf base..... 5
 - 5 Upper laminal cells subquadrate. Costa in transverse section with lax ventral hyalocysts..... *C. laxoventralis*
 - 5* Upper laminal cells oval. Costa in transverse section with small ventral hyalocysts, 10-15 µm wide..... 6
 - 6 Costa with dorsal lamellae.... *C. aureonitens*
 - 6* Costa without dorsal lamellae... *C. chilensis*
 - 7 Costa with dorsal lamellae, 4 cells high..... *C. pilifer*
 - 7* Costa smooth or ridged, without lamellae.... 8
 - 8 Upper laminal cells quadrate or rectangular..... 9
 - 8* Upper laminal cells oval..... 11
 - 9 Upper laminal cells quadrate..... 10
 - 9*Upper laminal cells rectangular..... *C. purpureocaulis*
 - 10 Leaves broadly lanceolate. Costa percurrent in a short mucro. lamina reaching the leaf tip..... *C. modestus*

- 10* Laves narrowly lanceolate. Costa excurrent in a long awn. Lamina vanishing above midleaf..... *C. incrassatus*
- 11 Transverse section of costa with ventral stereids. Costa filling ½-¾ of leaf width. *C. clavatus*
- 11* Transverse section of costa with ventral hyalocysts. Costa filling 1/3-1/2 of leaf width, with side nerves. Plants robust, blackish, vermicular foliate. Upper laminal cells elongate oval, strongly pitted..... *C. acuminatus*
- 12 Upper laminal cells rectangular..... 13
- 12* Upper laminal cells oval....*C. vesticaulis*
- 13 Transverse section of costa with ventral stereids... *C. purpureocaulis* ssp. *aberrans*
- 13* Transverse section of costa with ventral hyalocysts*C. pyriformis*

Interestingly, there is only one of 14 species with incrassate basal laminal cells in Chile and 10 of 14 species have hyaline hairpoints, both a very unusual percentage as compared with other floras.

List of new records of Campylopodioidae

During fieldwork for the BRYO AUSTRAL project in southern Chile in 2001, several Campylopodioidae have been collected which are compiled here.

The first number of the collecting number indicates the locality (list of localities see appendix).

Campylopidium medium (Duby) Giese & Frahm
8-4. New to region X.

Campylopus acuminatus Mitt.

11-4, 20-2. The specimen 20-2 is from a bog, 11-4, however, from a lava flow. The latter has narrower, more elongate leaves. The leaves are usually straight but plants with hamate leaves are intermixed.

Campylopus acuminatus Mitt. var. *kirkii* (Mitt.)
J.-P. Frahm, new to Chile

20-3, 20-4. A variety with cucullate instead of piliferous leaf tips, which was so far only known from Australia and New Zealand. Interestingly, both taxa were found in mixed tufts. There are several species with cucullate and piliferous varieties. The cucullate varieties have perichaetal leaves with piliferous hairpoints. The reasons causing these varieties are not known. 20-4 has elongate leaves at stem tips, perhaps for vegetative reproduction.

Campylopus chilensis De Not.

12-4

Campylopus clavatus (R. Brown) Wils. & Hook.f.

8-1a, 8-3, 11-3, 15-1

Campylopus introflexus (Hedw.) Brid.

8-1b, 8-2, 12-2, 20-3, 21-1, 24-1.

Campylopus pilifer Brid.

12-1. A remarkable southern record. The species is usually a vicariant species of *C. introflexus*. However, like in other parts of the world, the ranges of both species sometimes overlap (e.g. in southern Brazil or South Africa). *Campylopus pilifer* was recorded only three times before from Chile (from IX and X. region, Valdivia and Juan Fernandez Islands), and this locality is situated several hundred kilometres south of Valdivia, the former southernmost record. The plants of this specimen have conspicuous short upper laminal cells.

Campylopus pyriformis (Schultz) Brid.

12-3

Pilopogon schilleri Herz.

15-2

(1) XII. Region; Prov. Magallanes, Punta Arenas, Reserva Forestal Magallanes, Nothofagus pumilio-N. betuloides Wald (ca. 15 m hoch), 250-350 m, Nothofagus pumilio-Wald (max 12 m) 350-430 m, 53° 09' 10'' S, 71° 01' 34,9'' W. 14.2.01 u. 21.2.01.
