The Spindle-Whorl	51
The Loom Weights	
Cult of the Thracian Horseman	
Notes on <i>Xaragmata</i>	

*The Fates invented the seven letters: Alpha, Beta, Eta, Tau, Iota, Upsilon.
Others say, that Mercury took them from the Cranes in flight; those letters
they form as they fly.*

– Gaius Julius Hyginus

“Skylla”

The first thing / harmonised the one
in the middle of the sphere is named
THE HEARTH.

*Lepenski Vir II. Sculpture No. 43.
Fish-goddess (in trapezoid plan).
By the Lepen Whirlpool in the Iron
Gates of the Danube: 6500-5500BCE.*

rich mineral deposits on the surface of things;
 geology and prehistory – a
thousand facts induced a thousand
 fantasies of form and purpose,
structure and the life which had gone into the making of
 what I saw and
 what I was.

the strings were the tension
the concavities plunged me into the depth of water,
caves or shadows.
I like to dream of things that rise out of the ground.
receding tides made strange calligraphy
on pale granite sand that sparkled with felspar and mica.

I draw from any point, G,
two perpendicular lines the one to the other, GV, G ,
from each of which I take as many as I wish of equal and
contiguous parts,
beginning with G, that I name 1, 2, 3, 4,
etc.; and these numbers are *the exponents*.
Next I join the points of the first –
form a triangle it is *the base* – I join
two points of the second – form a second
 And thus joining all
points of division with the one same exponent – /
lines parallel to the sides by their intersection form little squares
 I call the cell.

Now, the numbers that are set in each cell are found by this method.

The number of the first cell right angle arbitrary but,
that one being placed,
the others are forced; and for this reason the former is called
generator – /

The number of each cell is equal to that of the cell preceding
in its perpendicular rank,
plus the cell which precedes in its parallel rank.

Let E, C be any two contiguous
cells of one same base: I say that

E (*inferior*) is to C (*superior*) as 2 (*because there are two cells from E
to the bottom: namely E, H*) as 3 (*because there are three cells from C
to the top: namely C, R, μ*).

Those who will wish to take an interest will find
perhaps better End therefore with the following
problem – /

A scarlet circle on the wall, a slender white bottle on a shelf near it,
a bright blue box and fishing floats that rest in the hand like a bird,
weighty pebbles, dull grey, some gleaming white, all these move about
the room and as they are placed,
make the room gay or serious,
bright as a frosty morning and
nearly always give a tremendous feeling of work
because they are so much a part of the different seasons and varied light
interrelated masses conveying an emotion;
perfect relationship between the mind and
the colour, light and weight which is the stone.
my studio was a jumble of children, rocks, sculptures,
trees, importunate flowers and washing. We were
picking our salads in the hedgerows,
I wasn't trying to tell a story, but the experience proved a theory I had –
no matter how many people involved – their action & poise & intention
produced drawings rather like a ballet;
though the ballet is contrived.
In a fearful emergency / there is no tumult
but thrusts and stresses of internal structure.

There is no point of local weakness inherent in the system. – /

The great circles of tetra and icosahedron are discontinuous in octa,
continuous in (Dymaxion),
i.e. vector equilibrium-central
of simultaneously zero phase alt-base-vol.

= empty set

of angular constants and central 2 [mass]

or inherently select [first] [axis].

Both tetra and icosahedron spinnable into completion of 6 + 15 great circles.

In each case tetra becomes 2 fold as positive negative tetra

inseparable from spherical cube. These 6 great

circles reoccur as doubled in octahedron visible 3 gt. cir.

and as 6 equations of icosahedron's primary icosahedron spun to 15

gt. cir. becomes indivisible 2 tetra

(pos + neg) dodecahedron + 2 octahedron. (pos + neg.)

rotatable but non-compressible as are liquids and

triple bond

Tetra
is CRYSTALLINE

For instance in dealing as does nature in such structural complexes as
trees. All compressional integrity is flexurally distributed in the liquid
or edge = double bond phase where slam loads or shocks are inhibited
by compressing of gases = single bonds = vertexial emphasis and these
flexibly contained

by crystalline or

triple bond or

Extending from the Carpathian Mountains
to the estuaries of the Dniester and Dnieper.*

Taking the cube of a binomial; let X equal one unknown and Y equal the other unknown.

The square of a binomial $(x-y)^2$ breaks down to $x^2 - 2xy - y^2$. The first number indicates the number of unknowns - 2, a binomial; 3, a trinomial; the second number indicates the power of the equation - 2, a square; 3, a cube . . .

The resulting equation - $xxxxy x yyy$ - is an eight unit one, and is the basis for the draft.

If the equation is applied to a plain weave, x is given one colour or texture value, and y is given another. Color principles will be used in selecting colors. One thread is substituted for each x or y with the pattern repeat being 8 threads.

The overshot weave is one used muchly by handweavers. The x may be given the value of two harnesses as 1-2; and y the value of 3-4. As many as four unknowns may be used with 1-2, 2-3, 3-4, and 1-4 being the harness pairing assigned. Should 2 threads have been used for each part, a 16 thread pattern repeat results. The threading draft may be used for overshot or a twill, opposite or other treadling may be used.

The cube of a binomial was the first to suggest itself to Miss Dietz on her starting to work with the idea in 1946. The same cube of a binomial $(x+y)^3$ seems to be the approach used by most applying Miss Dietz' idea to textiles.

And lest - according to Helen Lawton's expression in the Louisville COURIER-JOURNAL - you end up with the wrong answer instead

of a pair of drapes, here are the details:

$$x^3 + 3x^2y + 3xy^2 + y^3$$

The resulting equation - xxxxx y xx y xx y x yy x yy y y - is a 24 unit one. These 24 units will form the basis of writing the pattern in any weave.

The cube of a binomial $(x+y)^3$ can be expanded - or can be used in combination. As Miss Dietz was formerly a math teacher, don't you imagine she was happy when she wrote that equation: tossing in an extra xy, and then - as that man on the radio was spelling something backward - writing the equation backward. Wrong answer? No! Joking aside, Miss Dietz shows four of the possibilities to be found in the cube of a binomial.

"I found it possible to write the draft for any formula as long as there were sufficient combinations of harnesses to substitute for the terms of the algebraic expressions."

"As patterns grew and possibilities opened, I found that mathematics gave the beautiful space divisions, proportions, and individuality of pattern which the artist strives to achieve."

personalities back of an idea are of import - you feel you know Ada K. Dietz weaving the rug in $(x+y)^3$ on "Brunhilda" with Ruth E. Foster, standing there with the yarns.

If you have pioneer blood,
I think you will go from that frontier Miss Dietz has shown you

Cult of the Thracian Horseman

[An inscription in Sitovo Cave. Ancient Thrace.]

An eight-ft tall Probability-Machine named Sir Francis compares stock-market returns to pebbles that surge from narrows to pass

through a quincunx for a series of vertical shafts that accept every possible outcome to a sequence of errors; a god of Unreason

a matrix of 87 languages with 2,449 lexical items producing an estimated 7,800/9,800 BP [Result was robust to changes in coding

procedures, calibration points, rooting and priors.] The presence or absence of a word from each cognate set, was coded as 1 or 0.

Notes on *Xaragmata*

According to most histories the writing “translated” in these poems should not exist. Sumerians invented writing around 3200 BCE. The alphabet was invented later by the Phoenicians around 1050 BCE; and this is usually believed to have been derived from the Proto-Sinaitic script, in use from around 1850 BCE. The *Vinča* or Danube or Old European symbols do not conform to what we thought we knew of the past. Found on household artefacts across south-east Europe, the symbols are in the wrong place and from the wrong time – the oldest of these artefacts being a wooden disk carbon-dated to 5260BCE.

From northern Greece, the symbols proliferate with the rise of the *Vinča* culture in the Lower Danube and then can be seen to spread north along the shores of the Black Sea with the rise of the Cucuteni-Trypillian culture from 4800BCE.

Though sometimes called “proto-writing”, the linearity of the Old European script, plus the limited number of symbols employed, must make this designation dubious; the first being a feature consistent with true writing; the latter with the alphabet and syllabary. In fact, some *Vinča* signs look rather more like certain characters in Greek, Etruscan and Indus than the ostensible originals for the latter in the Phoenician script.

This apparent (perhaps deceptive) familiarity encourages (often wild) speculation. This poem participates in this creative paranoia, beginning with the assumption that the half-dozen basic symbols represent vowels, that additional marks modifying these represent consonants: – a semi-syllabary, like the later Iberian script, but part too of the, as yet, incomplete alphabet – those six/seven letters that Robert Graves believed the Pelasgoi possessed before King Cadmus brought the Phoenician letters to Greece.

I. “Skylia”

The Lepenski Vir culture pre-dates the *Vinča* culture that spread from the south and perhaps even less is known about it. The central settlement is in the Iron Gates gorge of the Danube on a plateau opposite a whirlpool that would have represented a threat to early sailors. Here, this people raised houses of startling uniformity and geometric rigour. Beginning with a hearth-stone, this tribe employed skills later associated with the Pythagoreans, first describing then bisecting circles spun from this central point, to produce a series of interlocking triangles (a “magic triangle”, in fact) – a trapezoid plan.

Something resembling concrete was then poured around the stones at the heart of this complex, and a superstructure raised over the whole. The final result anticipated the later *megaron*: a sacred precinct slightly set apart from the rest was yet an integral part of the domestic space. The sculptures of the gods set up to watch over the house seem fish-like in form, carved from boulders smoothed by the action of the river, and though the product of evident affection on the part of the artist, communicate strong sensations of terror: testifying to the unease that compelled the erection of the elegant mathematical structures on the edge of the Lepen whirlpool.

In *The Living Goddess* (1999), Gimbutas conflates Lepenski Vir with a matriarchal belief-system said to extend across Europe in this era. In contrast, Dragoslav Srejovic, in *Europe's First Monumental Sculpture: new discoveries at Lepenski Vir* (1972), states

that the culture was undoubtedly patriarchal, perceiving a story of power struggles in the changing patterns of settlement. Which interpretation is correct? – Markings that resemble symbols that appear in the later Vinča script are certainly present but there are significant discontinuities too. As Srejavic notes, later inhabitants of the site did not construct houses on the same rigorous geometrical model of the earlier culture. To some degree the mathematical / magical traditions of the original Lepenski Vir had been lost with the arrival of these strangers from the south.

I therefore liken Sculpture Number 43 – one of the few sculptures from the site not possessing a nickname – to *Skylla*: a figure in Greek mythology said to have suffered from the magical practices of the sorceress Kirke, a goddesses that Gimbutas identifies with the Vinča.

This section of the poem is constructed from the following found material:

- Philolaus, *On the World* (now lost, this passage is quoted by Stobaeus in *Anthology*: I xxi 7-8.)
- Barbara Hepworth, *A Pictorial Autobiography* (London: Tate Publishing, 1985).
- Blaise Pascal, *Traité du triangle arithmétique* (1653). The text follows the translation produced by Anna Savitsky and published in David Eugene Smith, *A Source Book in Mathematics* (Courier Dover Publications, 1959).
- Hugh Kenner, *Geodesic Math and How To Use It* (University of California Press, 1976).
- R. Buckminster-Fuller, “Project – Noah’s Ark No. II” (Buckminster-Fuller archive at the University of Stanford: Collection No. M1090 – Box 9, Folder 6).

II. The Spindle-Whorl

In *The Goddesses and Gods of Old Europe* (1974); *The Language of the Goddess* (1989), *The Civilisation of the Goddess* (1991), and *The Living Goddesses* (1999), celebrated Soviet archaeologist Marija Gimbutas argues that – prior to the invasion of patriarchal indo-European peoples – there existed a European-wide, Matriarchal culture. While the conflation of so many varied cultures strikes me as no less reductive than previous Structuralist readings, I was fascinated by certain passages relating to the bird-goddess that suggested the Sirens, the Harpies and the Fates were once one and the same thing. In Plato’s *Republic*, Gimbutas points out, the Sirens are not, as in Homer, demons merely, preying upon strangers, but are part of the fabric of creation, occupying a place on each the discs that make up a strange object resembling a *spindle-whorl*, said to represent the physical universe.

Plato’s description of the latter recalls other objects in Greek writings that attempt to explain musical harmony. – Not by chance, these resemble the early forms of siren being developed in nineteenth-century Europe by scientists such as Hermann von Helmholtz, to investigate physical properties of sound. This work provided the basis for experiments in synthesised music in the next century, by pioneers such as Delia Derbyshire.

This section celebrates this woman’s life and work (just as the previous poem is a tribute to sculptor Barbara Hepworth). Much of the found poetry featured in this part is taken from the Delia Derbyshire archives, recently put together by the librarians at the University of Manchester.

- Delia Derbyshire, Notes for “The Dreams” – DD153803.

III. The Loom Weights

My own understanding of the Vinča script first began to take shape when I recognized symbols on a bread-seal as star-signs (inverted so as to appear the right way around when stamped onto the bread). The thought of a culture committing its religious mysteries to pastry appealed to me. What had struck me most forcibly about these cultures was the extent to which the domestic and sacred had not as yet been compartmentalized. If there is poetry to be found in these scripts it must be functional: no false division between star-signs, musical notation, writing and mathematics. If there is truth in W.H. Auden’s idea that *poetry makes nothing happen* this is something beyond the obvious meaning: *poesis* means *making*.

- M.S.F. Hood, “The Tartaria Tablets”, *Antiquity*, No. 41, pp.99-102 (1967).
- J. Makkay, “The Tartaria Tablets”, *Orientalia*, No. 37, pp.272-289 (1968).

- D.G. Zanotti, “The Position of the Tartaria Tablets within the Southeast European Copper Age,” *American Journal of Archaeology*, No. 87, pp.209-213 (1983).

The section is taken entirely from the work of another “culture-hero”, the American Ada K. Dietz: her *Algebraic Expressions in Handwoven Textiles* (Louisville, Kentucky: The Little Loom House, 1949)

IV. Cult of the Thracian Horseman

Interpretation of this inscription reflects the fraught history of this region in Europe.

These letters continue to attract the attention of cranks with nationalist axe to grind. Macedonian – if read from left to right. Albanian – if read from right to left. – Marija Gimbutas might have taken a grim delight in the fact that – however these letters are read – they are invariably taken to mark the passing of some patriarch. In the writing of Gimbutas both languages (and the patriarchal system) can be traced to the Kurgan invaders from the Eurasian steppes, who overwhelmed the indigenous cultures of Old Europe in the period in which the letters were carved. Her theory has been confirmed by the geneticists (studying the male-chromosome in European DNA) and discredited by the linguists (who argue that the Old Europeans in this region were Indo-European themselves). What caught my interest was not the controversy itself – but the fact that the geneticists and linguists alike were obtaining their mutually exclusive results from the same mathematical procedures. Sir Francis Galton was the first theologian of what he termed the “god of unreason”. In this poem he therefore represents the father-god that has been presiding spirit in Western culture since the incursion of the Thracian (or Phrygian) Horseman. A reproduction of the “Probability Machine” he described, in the headquarters of *Index Financial Advisors*, stands as a totemic acknowledgement of the extent to which our current economic system relies upon the theories of Galton.

As the quincunx pattern might suggest, the mathematics represent a development of the magic triangle in part one, another application of the Binomial Theories traced through sections two and three: the sacred wisdom I am attributing to these forgotten tribes. Ladislaus Bortkiewicz was the first to collate randomly generated data on an X/Y axis – thereby discovering that these corresponded to Poisson’s Distribution (a sine wave). Famously, the dataset consisted of the number of Prussian soldiers killed by horses. In the poem the probability curve (the chances of death by horse) is likened to the shape of those tumuli, the burial mounds, from which the Kurgan have derived their name.
