During the past decades, organofluorine compounds have attracted a lot of attention in the field of organic and medicinal chemistry due to the profound effect of fluorine on bioactive molecules. Azetid-2-ones or  $\beta$ -lactams are very important compounds in organic synthesis due to their high ring strain energy, which allows for further elaboration toward a variety of nitrogen-containing acyclic and heterocyclic target compounds. In light of the beneficial effects of fluorine introduction,  $\beta$ -lactams bearing a trifluoromethyl group comprise interesting entities for the construction of novel targets with promising bioactivities. Consequently, the preparation and deployment of CF<sub>3</sub>-substituted azetid-2-one building blocks **I**, **II**, **III** toward a diverse set of functionalized CF<sub>3</sub>-amines and CF<sub>3</sub>-azaheterocycles was demonstrated.

In the first part, 4-CF<sub>3</sub>-azetid-2-ones **I** were successfully prepared, and their synthetic potential as eligible new building blocks for the construction of CF<sub>3</sub>-containing azetidines, diaminopropanes, aminopropanol derivatives, 1,3-oxazinanes and 1,3-oxazinan-2-ones was evaluated.<sup>1</sup> In the second part, 4-trifluoromethyl-3-oxo- $\beta$ -lactams **II** were synthesized from substrates **I** and unexpectedly transformed into 2-[(2,2-difluorovinyl)amino]-2-oxoacetates as major products, accompanied by minor amounts of 2-oxo-2-[(2,2,2-trifluoroethyl)amino]acetates. This peculiar reactivity was investigated in-depth from both an experimental and a computational point of view, in order to shed light on the underlying reaction mechanism.<sup>2</sup> In the final part, 3-methylene-4-(trifluoromethyl)azetid-2-ones **III** were efficiently prepared from 3-oxo- $\beta$ -lactams **II** and successfully evaluated as novel substrates in organic synthesis. In particular, Michael additions, electrophilic additions and cycloadditions were applied to allow an easy access to a broad variety of stereodefined mono- and spirocyclic 4-CF<sub>3</sub>- $\beta$ -lactams.<sup>3</sup> This  $\beta$ -lactam building block approach has thus been shown to provide a convenient new entry into trifluoromethylated scaffolds as useful synthetic intermediates *en route* to a variety of functionalized target structures.
