Acta Crystallographica Section A: Foundations of Crystallography covers theoretical and fundamental aspects of the structure of matter. The journal is the prime forum for research in diffraction physics and the theory of crystallographic structure determination by diffraction methods using X-rays, neutrons and electrons. The structures include periodic and aperiodic crystals, and non-periodic disordered materials, and the corresponding Bragg, satellite and diffuse scattering, thermal motion and symmetry aspects. Spatial resolutions range from the subatomic domain in charge-density studies to nanodimensional imperfections such as dislocations and twin walls. The chemistry encompasses metals, alloys, and inorganic, organic and biological materials. Structure prediction and properties such as the theory of phase transformations are also covered.

Abstract

One of the terms of reference published in 1992 (*Acta Cryst.* A48, 922–946) in the report of the (at that time) *Ad Interim* Commission on Aperiodic Crystals was 'to co-operate with other Commissions of the IUCr in establishing adequate guidelines and standards for articles to be published in IUCr journals reporting structural investigations of aperiodic crystals and theoretical investigations of aperiodic patterns'. It was soon recognized by the Commission that the establishment of a checklist for the publication of incommensu-

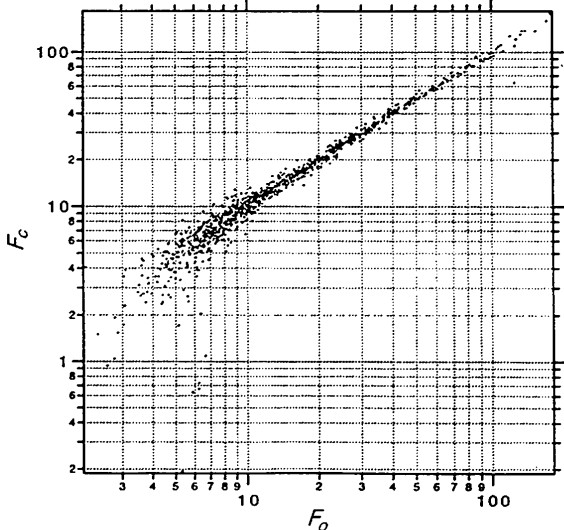

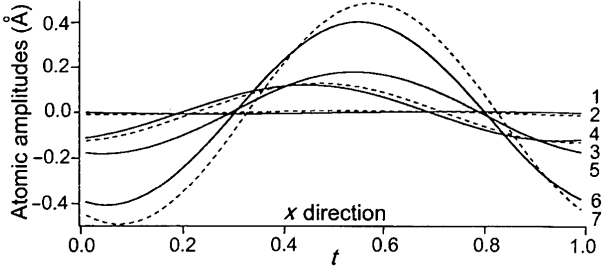

rately modulated structures was perhaps the most urgent task. One of the first attempts to address the problem of publishing incommensurate structures was presented during a discussion organized in 1991 in Leikeitio, Spain, in a workshop dedicated to methods of structural analysis of modulated structures and quasicrystals. Since this meeting, the work of the Commission progressed interactively by numerous exchanges on the occasions of international meetings and mostly by electronic correspondence. The Checklist was accepted in 1994 by the Executive Committee of the IUCr. The opinion of the Commission on Journals was also requested and, following the comments of its members, the Checklist has been completed with an example of an incommensurate crystal structure illustrating each specific item that is required in the Checklist.

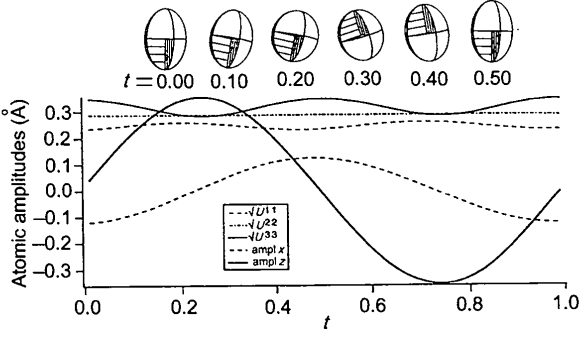

† Final checklist accepted on 15 January 1996 by the Commission on Aperiodic Crystals, on 1 September 1994 by the Executive Committee and on 25 November 1994 by the Commission on Journals.

This list specifies the information to be given in papers reporting analyses of incommensurate modulated structures. In general, nomenclature should follow the suggestions given in <i>International Tables for Crystallography</i> (1992), Vol. C, pp. 797–847. Dordrecht: Kluwer Academic Publishers.	In this column, an example of an incommensurate structure is presented in order to illustrate the corresponding items required by the checklist. The structural data are taken from <i>Acta Cryst.</i> (1994), B50, 333–343.
Crystal data	
Chemical formula.	(C ₃ H ₇ NH ₃) ₂ MnCl ₄
Formula weight.	316.98
Source of material.	Slow evaporation at room temperature of a stoichiometric aqueous solution of <i>n</i> -C ₃ H ₇ NH ₃ Cl (Sigma) and MnCl ₂ (Merck, > 98%)
Crystal shape and size.	Platelet, {001} pinacoid [0.064 (4) mm thick], {111} orthorhombic dipyrmaid [base: 0.618 (4) × 0.612 (4) mm]
If observed, mention the existence of crystal faces associated to incommensurate modulation vectors.	The crystals were grown at room temperature at which the structure is commensurate

Method of determining the independent modulation wave vector(s) \mathbf{q}_i .	Obtained by averaging the fractional parts of index h of ten accurately centered first-order satellites at $2\theta \simeq 50^\circ$																																								
Temperature variation of the modulation wave vector(s), if measured.	Reported in <i>Solid State Commun.</i> 45 , 1089–1092																																								
Method of measuring satellite reflections ($m_i \neq 0$). Comparison between intensity profiles of satellite reflections and main reflections ($m_i = 0$).	Same as for main reflections FWHM ($^\circ$, $hklm$): 0.60 (4000), 0.52 (0400), 0.48 (0080), 0.59 (0,4,13,1), 0.52 (118 $\bar{1}$)																																								
Absorption correction applied (maximum and minimum transmission values).	0.638–0.053 (analytical correction method applied)																																								
For each reflection class m ($= \sum m_i $): number of measured reflections; range of h, k, l ; $\sin \theta / \lambda$ range; internal R value from merging equivalent reflections. Maximum value of θ . Number of independent reflections, total and for each reflection class. Criterion for recognizing unobserved reflections. Number of observed reflections, total and for each reflection class.	<table border="1"> <thead> <tr> <th></th> <th>$m = 0$</th> <th>$m = 1$</th> <th>$m = 2$</th> <th>Total</th> </tr> </thead> <tbody> <tr> <td>R_{int} (2θ: 3–70°, full sphere)</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td> with absorption correction</td> <td>0.063</td> <td>0.067</td> <td>0.083</td> <td>0.064</td> </tr> <tr> <td> without absorption correction</td> <td>0.137</td> <td>0.186</td> <td>0.134</td> <td>0.144</td> </tr> <tr> <td>Number of reflections</td> <td>1846</td> <td>3820</td> <td>897</td> <td>6563</td> </tr> <tr> <td> $[> 3\sigma(I)]$</td> <td>1331</td> <td>2126</td> <td>127</td> <td>3584</td> </tr> <tr> <td>Independent reflections</td> <td>524</td> <td>1072</td> <td>292</td> <td>1888</td> </tr> <tr> <td> $[> 3\sigma(I)]$</td> <td>369</td> <td>627</td> <td>60</td> <td>1056</td> </tr> </tbody> </table>		$ m = 0$	$ m = 1$	$ m = 2$	Total	R_{int} (2θ : 3–70°, full sphere)					with absorption correction	0.063	0.067	0.083	0.064	without absorption correction	0.137	0.186	0.134	0.144	Number of reflections	1846	3820	897	6563	$[> 3\sigma(I)]$	1331	2126	127	3584	Independent reflections	524	1072	292	1888	$[> 3\sigma(I)]$	369	627	60	1056
	$ m = 0$	$ m = 1$	$ m = 2$	Total																																					
R_{int} (2θ : 3–70°, full sphere)																																									
with absorption correction	0.063	0.067	0.083	0.064																																					
without absorption correction	0.137	0.186	0.134	0.144																																					
Number of reflections	1846	3820	897	6563																																					
$[> 3\sigma(I)]$	1331	2126	127	3584																																					
Independent reflections	524	1072	292	1888																																					
$[> 3\sigma(I)]$	369	627	60	1056																																					
Standard reflections chosen (at least one reflection for each measured reflection class should be included) and their intensity variation during the measurement.	1190; 0080; 4400; 0011; $2\bar{2}\bar{1}\bar{1}$; 041 $\bar{1}$ Loss of intensity: $\sim 30\%$ within 216 h Equal decay for $ m = 0, 1$																																								
Thermal history of the sample(s). Temperature stability during the measurement.	Freshly grown crystals at room temperature were heated once to the temperature of measurement. The temperature was estimated from the T dependence of the modulation vector $\mathbf{q}(T)$																																								
Characteristics of diffuse scattering phenomena if any.	–																																								
Refinement																																									
Brief outline of the refinement method used. Computer programs employed.	The average structure was solved first, followed by the incommensurate structure refinement. <i>SHELX</i> [Sheldrick (1978). <i>SHELXTL. An Integrated System for Solving, Refining and Displaying Crystal Structures from Diffraction Data.</i> University of Göttingen, Federal Republic of Germany] and <i>MSR</i> [Paciorek (1991). <i>Methods of Structural Analysis of Modulated Structures and Quasicrystals</i> , edited by J. M. Pérez-Mato, F. J. Zúñiga & G. Madariaga, pp. 268–279. Singapore: World Scientific] were used for the refinements of the structure																																								
Structure-factor calculation: analytical expression for the structure factor and all the modulation functions used. This information should be sufficient to reproduce the modulations of all the symmetry-equivalent atoms. Method and accuracy of numerical integration, if any.	Structure-factor expressions taken from Paciorek & Chapuis [<i>Acta Cryst.</i> (1994), A50 , 194–203]. Additional modulated functions are derived in the original paper Gaussian integrations with 32 divisions																																								
Type(s) of modulation. Parameters used to describe the individual atomic modulation functions (including the modulation of thermal parameters, if any). Mention all tested models.	$u_i^\mu(t) = \sum_{n>0} [c_{i,n}^\mu \cos(2\pi nt) + s_{i,n}^\mu \sin(2\pi nt)]$ with $t = \mathbf{q}(\mathbf{n} + \mathbf{r}^\mu) \bmod 1$, $\beta_{ij}^\mu(t) = \beta_{ij,2}^\mu \cos(4\pi t + \chi_{ij,2}^\mu)$ t is the internal coordinate ranging between 0 and 1; i refers to the direction and \mathbf{r}^μ is the average position of atom μ within the unit cell \mathbf{n} of the average structure																																								
Symmetry restrictions and/or constraints on the structure parameters, if any.	Symmetry restrictions on coordinates, thermal displacement parameters and modulation parameters for the atoms on special sites. The parentheses indicate those Debye–Waller-factor (DWF) modulation parameters that are set to zero according to the phason/amplitudon parametrization proposed by Pérez-Mato <i>et al.</i> [<i>Solid State Commun.</i> (1991), 78 , 33–37]																																								

	<p>The restrictions are calculated according to expressions $\mathbf{u}^{\lambda}(t) - \mathbf{R}\mathbf{u}^{\mu}[R_{44}(t - \tau_4)]$ and $\mathbf{T}^{\lambda}(t) - \mathbf{R}\mathbf{T}^{\mu}[R_{44}(t - \tau_4)]\mathbf{R}^t$, where μ and λ denote the properties before and after the transformation, \mathbf{u} is a vector of the displacive modulation functions, \mathbf{T} the DWF tensor, \mathbf{R} and \mathbf{R}^t the rotational part and its transpose of the standard space group and τ_4 the internal coordinate translation</p> <p>Wyckoff notation: 4(a); site symmetry: $(\frac{2}{1})_y / (\frac{1}{1})_y$; atom: Mn;</p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td>0</td><td>0</td><td>x1s1</td><td>0</td><td>x1s2</td></tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> <tr> <td>0</td><td>0</td><td>x3s1</td><td>0</td><td>x3s2</td></tr> <tr> <td>β^{11}</td><td>$(\beta^{11}c1)$</td><td>0</td><td>$\beta^{11}c2$</td><td>0</td></tr> <tr> <td>β^{22}</td><td>$(\beta^{22}c1)$</td><td>0</td><td>$(\beta^{22}c2)$</td><td>0</td></tr> <tr> <td>β^{33}</td><td>$(\beta^{33}c1)$</td><td>0</td><td>$\beta^{33}c2$</td><td>0</td></tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> <tr> <td>β^{13}</td><td>$(\beta^{13}c1)$</td><td>0</td><td>$\beta^{13}c2$</td><td>0</td></tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr> </table>	0	0	x1s1	0	x1s2	0	0	0	0	0	0	0	x3s1	0	x3s2	β^{11}	$(\beta^{11}c1)$	0	$\beta^{11}c2$	0	β^{22}	$(\beta^{22}c1)$	0	$(\beta^{22}c2)$	0	β^{33}	$(\beta^{33}c1)$	0	$\beta^{33}c2$	0	0	0	0	0	0	β^{13}	$(\beta^{13}c1)$	0	$\beta^{13}c2$	0	0	0	0	0	0

Source of scattering factors.	Scattering factors for neutral atoms taken from <i>International Tables for X-ray Crystallography</i> (1974), Vol. IV (Birmingham: Kynoch Press)																																													
Starting structural model. Parameters refined.	As starting parameters, the coordinates of the δ phase at room temperature [Peterson & Willet (1972). <i>J. Chem. Phys.</i> 56 , 1879–1882] were used. An improved model with C1 and C2 on general positions 16(a) in <i>Abma</i> yielded a significantly better agreement. N and C3 were refined on the mirror plane 8(f)																																													
Use of F , F^2 or I in the refinement.	Refinement based on F																																													
Constraints in the refinement process if any; restraints on stereochemical quantities or other parameters and their weights, if any.	Bond distances and angles constraints for H atoms in the average structure Constraints on first-order harmonics of the temperature-factor modulation																																													
Number of reflections used in the refinement; number of refined parameters.	Model 5a 1058 reflections 80 parameters Model 5b 1888 reflections 80 parameters																																													
Method of locating and refining H atoms.	From stereochemical considerations. The modulation parameters were approximately constrained to the values of the bonded atom																																													
Weighting scheme in the refinement: definition of w for reflections and, in the case of the refinement restraints, for the pseudo-observations introduced.	$1/\sigma^2(F)$																																													
Overall, and for each reflection class, final values of $R = \sum(F_o - F_c) / \sum F_o $, $wR = [\sum w(Y_o - Y_c)^2 / \sum wY_o^2]^{1/2}$, where Y_o and Y_c are the observed and calculated coefficients specified above ($ F $, F^2 or I). Final value of $\Sigma = [\sum w(Y_o - Y_c)^2 / (m - n)]^{1/2}$ for all reflections. Ratio of maximum least-squares shift to error in final refinement cycle.	<p>R factors for various models of modulated structures: No. 5a harmonic displacive, Axe correction (global phason), $I > 3\sigma(I)$; No. 5b harmonic displacive, Axe correction (global phason), all observed reflections</p> <p>For all models: $\Delta_{\max}/\sigma < 0.001$, goodness of fit $\simeq 2$, $OSR_{\text{all}} \simeq 0.99$, R values are multiplied by 100</p> <p>$R_{\text{all}}: R_{\text{MSR}} = \frac{\sum F_{i,o}/S_i - \bar{E} }{\sum F_{i,o}/S_i}$, $R_w: R_{w,\text{MSR}} = \left(\frac{\sum w(F_{i,o}/S_i - \bar{E})^2}{\sum w(F_{i,o}/S_i)^2} \right)^{1/2}$; $OSR: \sum F_c / \sum F_o$; N_p: number of parameters</p> <table style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>No.</th><th>R_{all}</th><th>$R_{w,\text{all}}$</th><th>$R_{w,\text{main}}$</th><th>$R_{w,\text{sat}}$</th><th>$R_{w,1}$</th><th>$R_{w,2}$</th><th>OSR_2</th><th>N_p</th><th>$C^{\text{Axe/Ove}}$</th></tr> </thead> <tbody> <tr> <td>5a</td><td>5.22</td><td>3.93</td><td>3.1</td><td>6.8</td><td>6.5</td><td>11.9</td><td>0.91</td><td>80</td><td>0.17 (1)</td></tr> <tr> <td>5b</td><td>9.81</td><td>6.82</td><td>6.2</td><td>9.1</td><td>6.6</td><td>18.9</td><td>0.72</td><td>80</td><td>0.17 (1)</td></tr> </tbody> </table>	No.	R_{all}	$R_{w,\text{all}}$	$R_{w,\text{main}}$	$R_{w,\text{sat}}$	$R_{w,1}$	$R_{w,2}$	OSR_2	N_p	$C^{\text{Axe/Ove}}$	5a	5.22	3.93	3.1	6.8	6.5	11.9	0.91	80	0.17 (1)	5b	9.81	6.82	6.2	9.1	6.6	18.9	0.72	80	0.17 (1)
