École Polytechnique Fédérale de Lausanne, Switzerland*

---

What does “Verification & Validation” (V&V) mean?

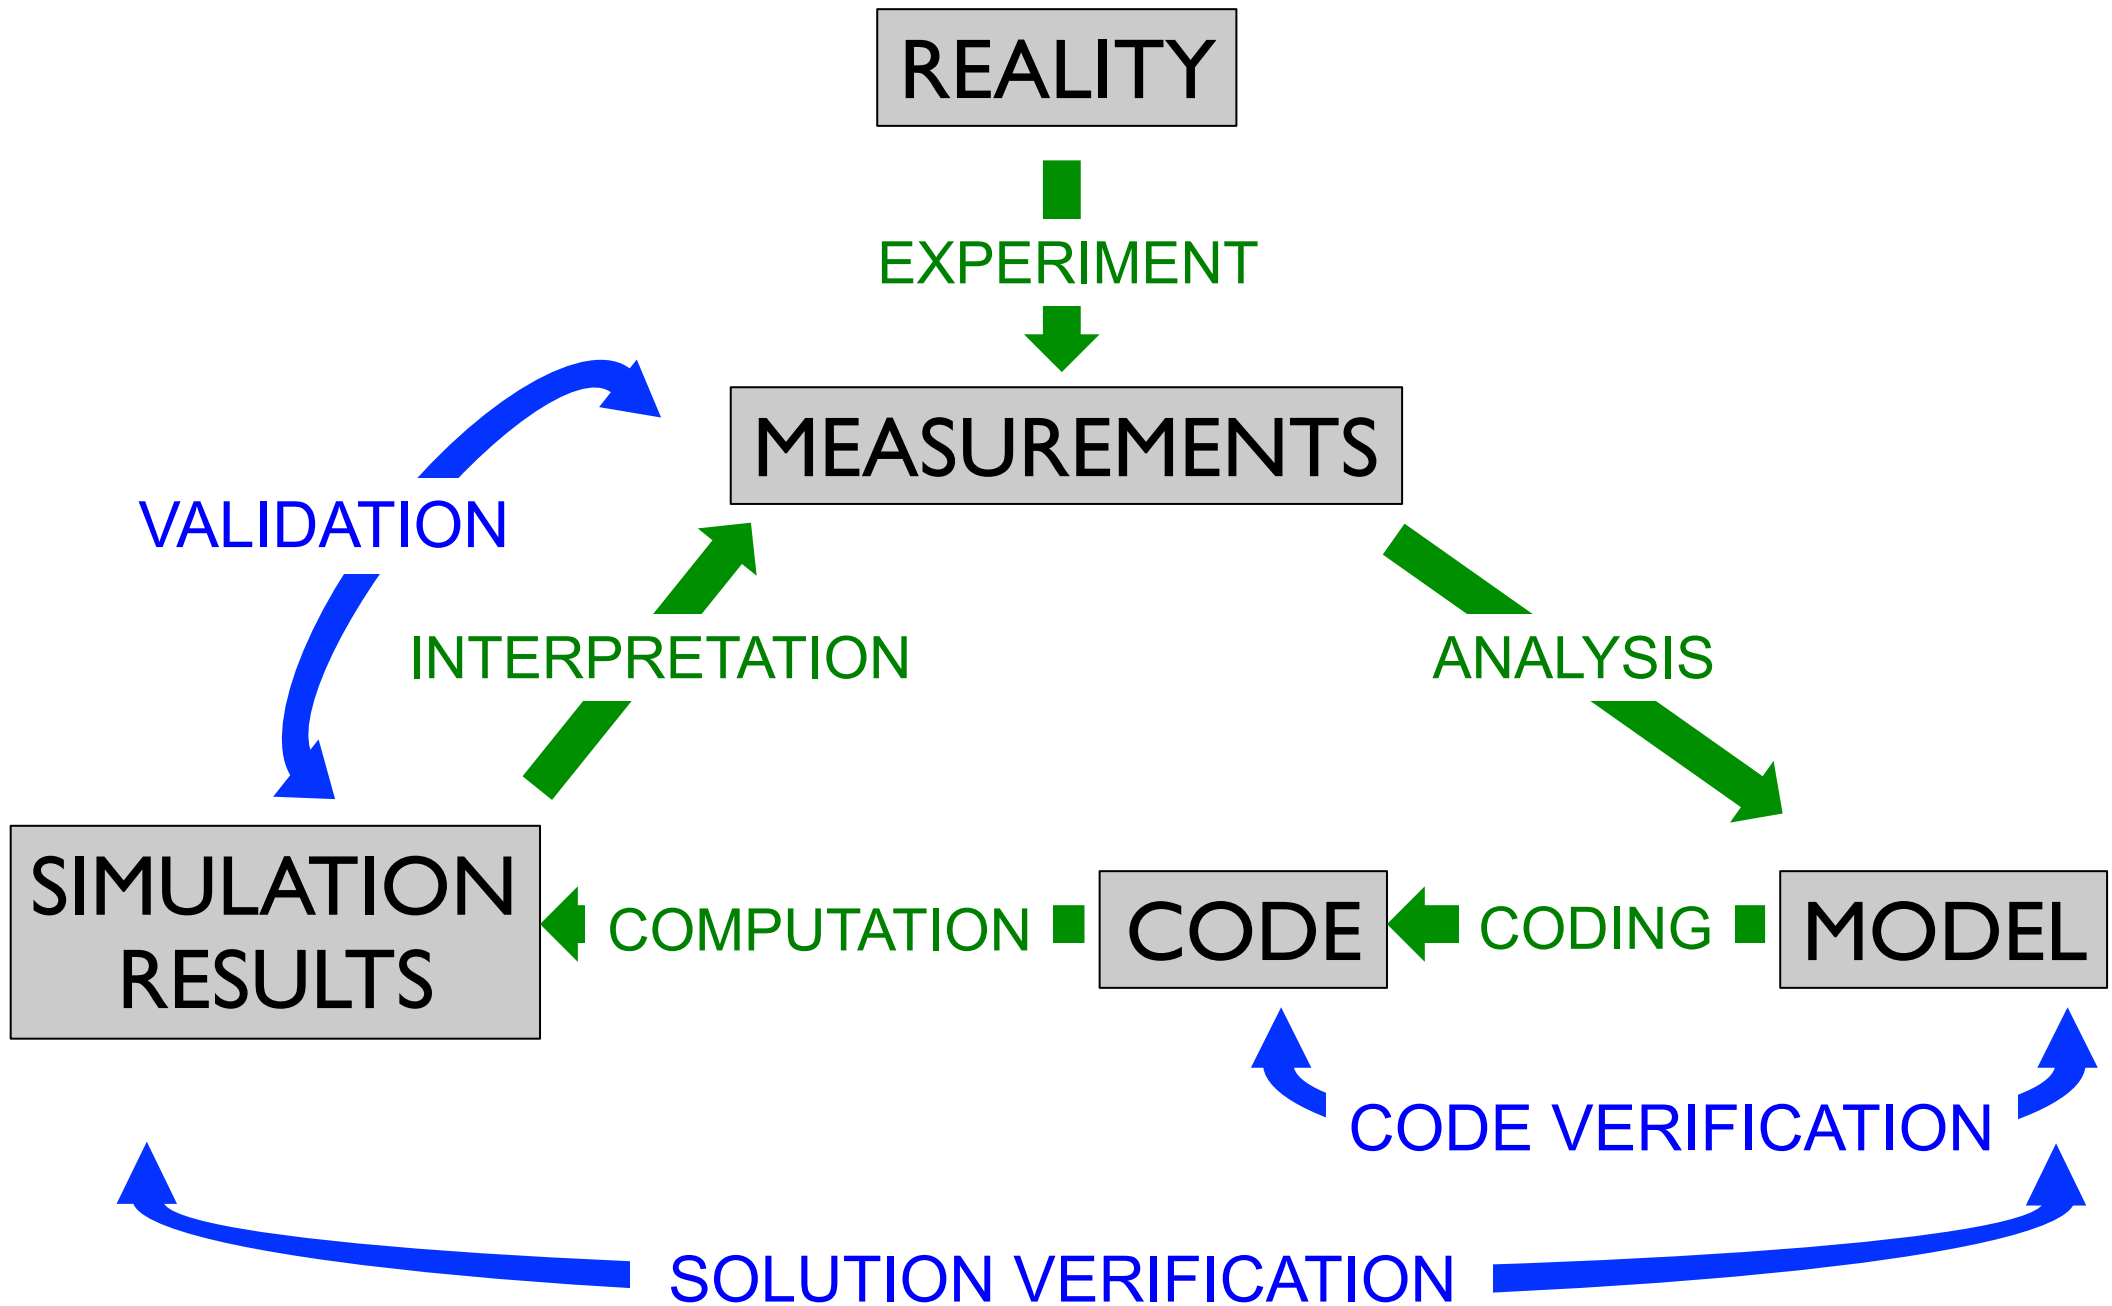

What V&V methodology did we use?

A practical example: GBS code and TORPEX experiment

What have we learned?

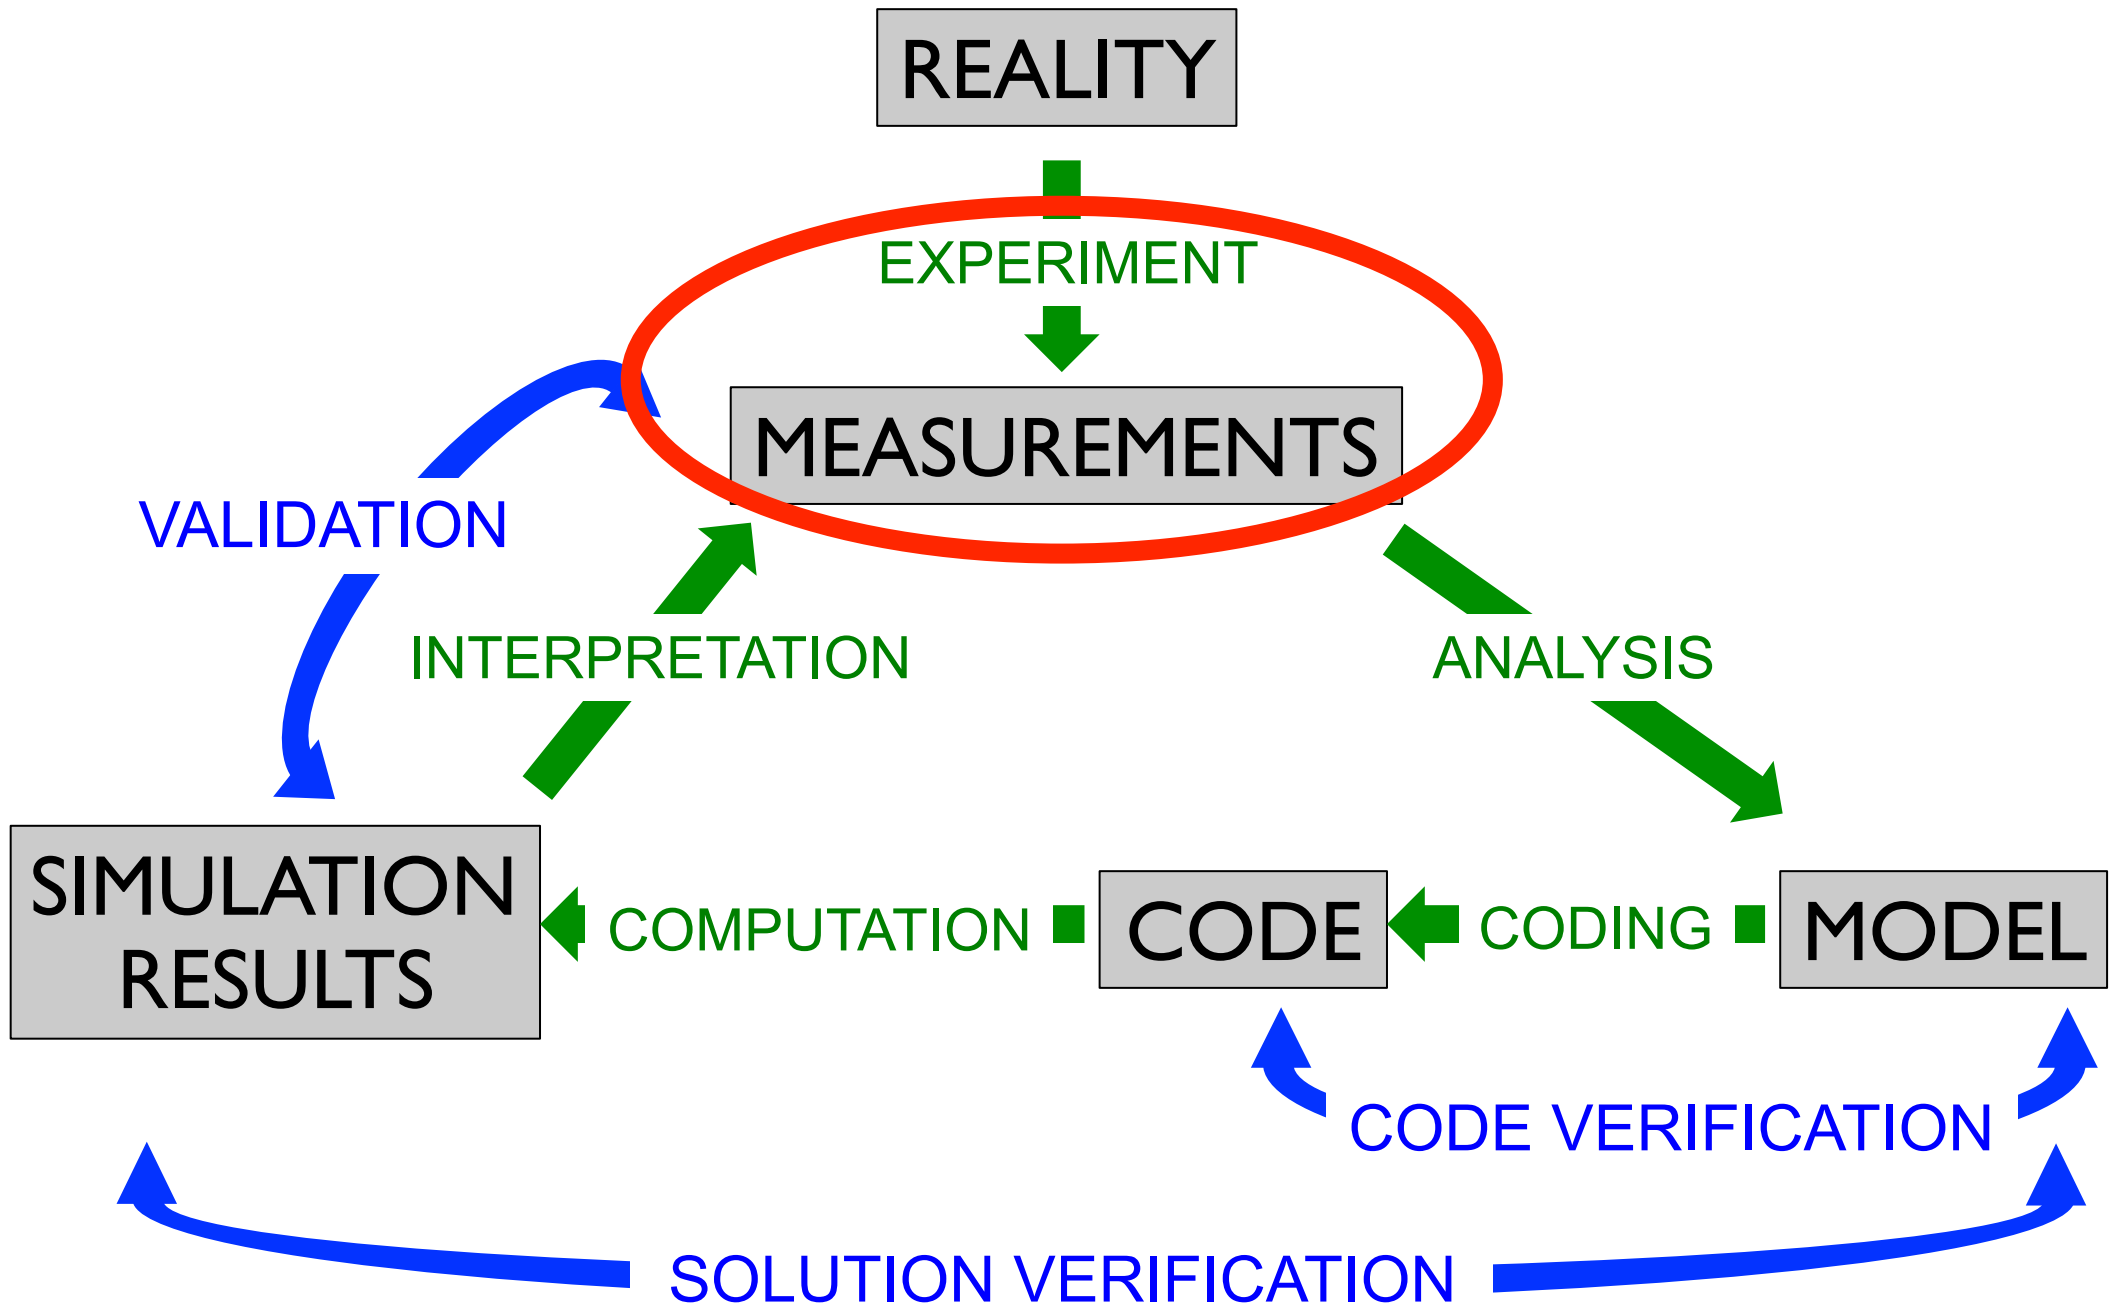

# Verification & Validation

---

# Verification & Validation

---

# The TORPEX device

---

# The TORPEX device

---

# The TORPEX device

---

# The TORPEX device

---

# The TORPEX device

---

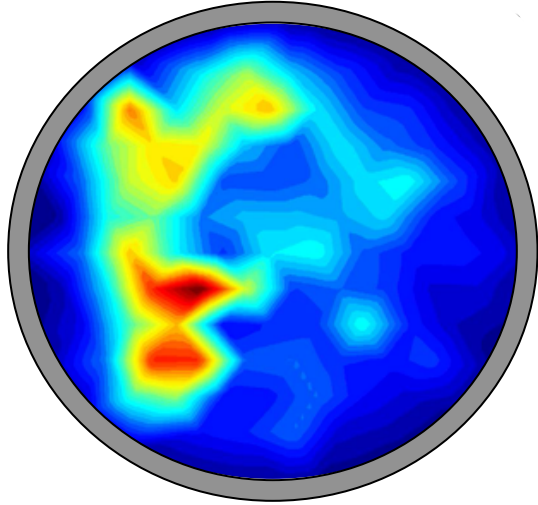

# Key elements of the TORPEX device

---

# TORPEX: an ideal verification & validation testbed

---

- Complete set of diagnostics, full plasma imaging possible

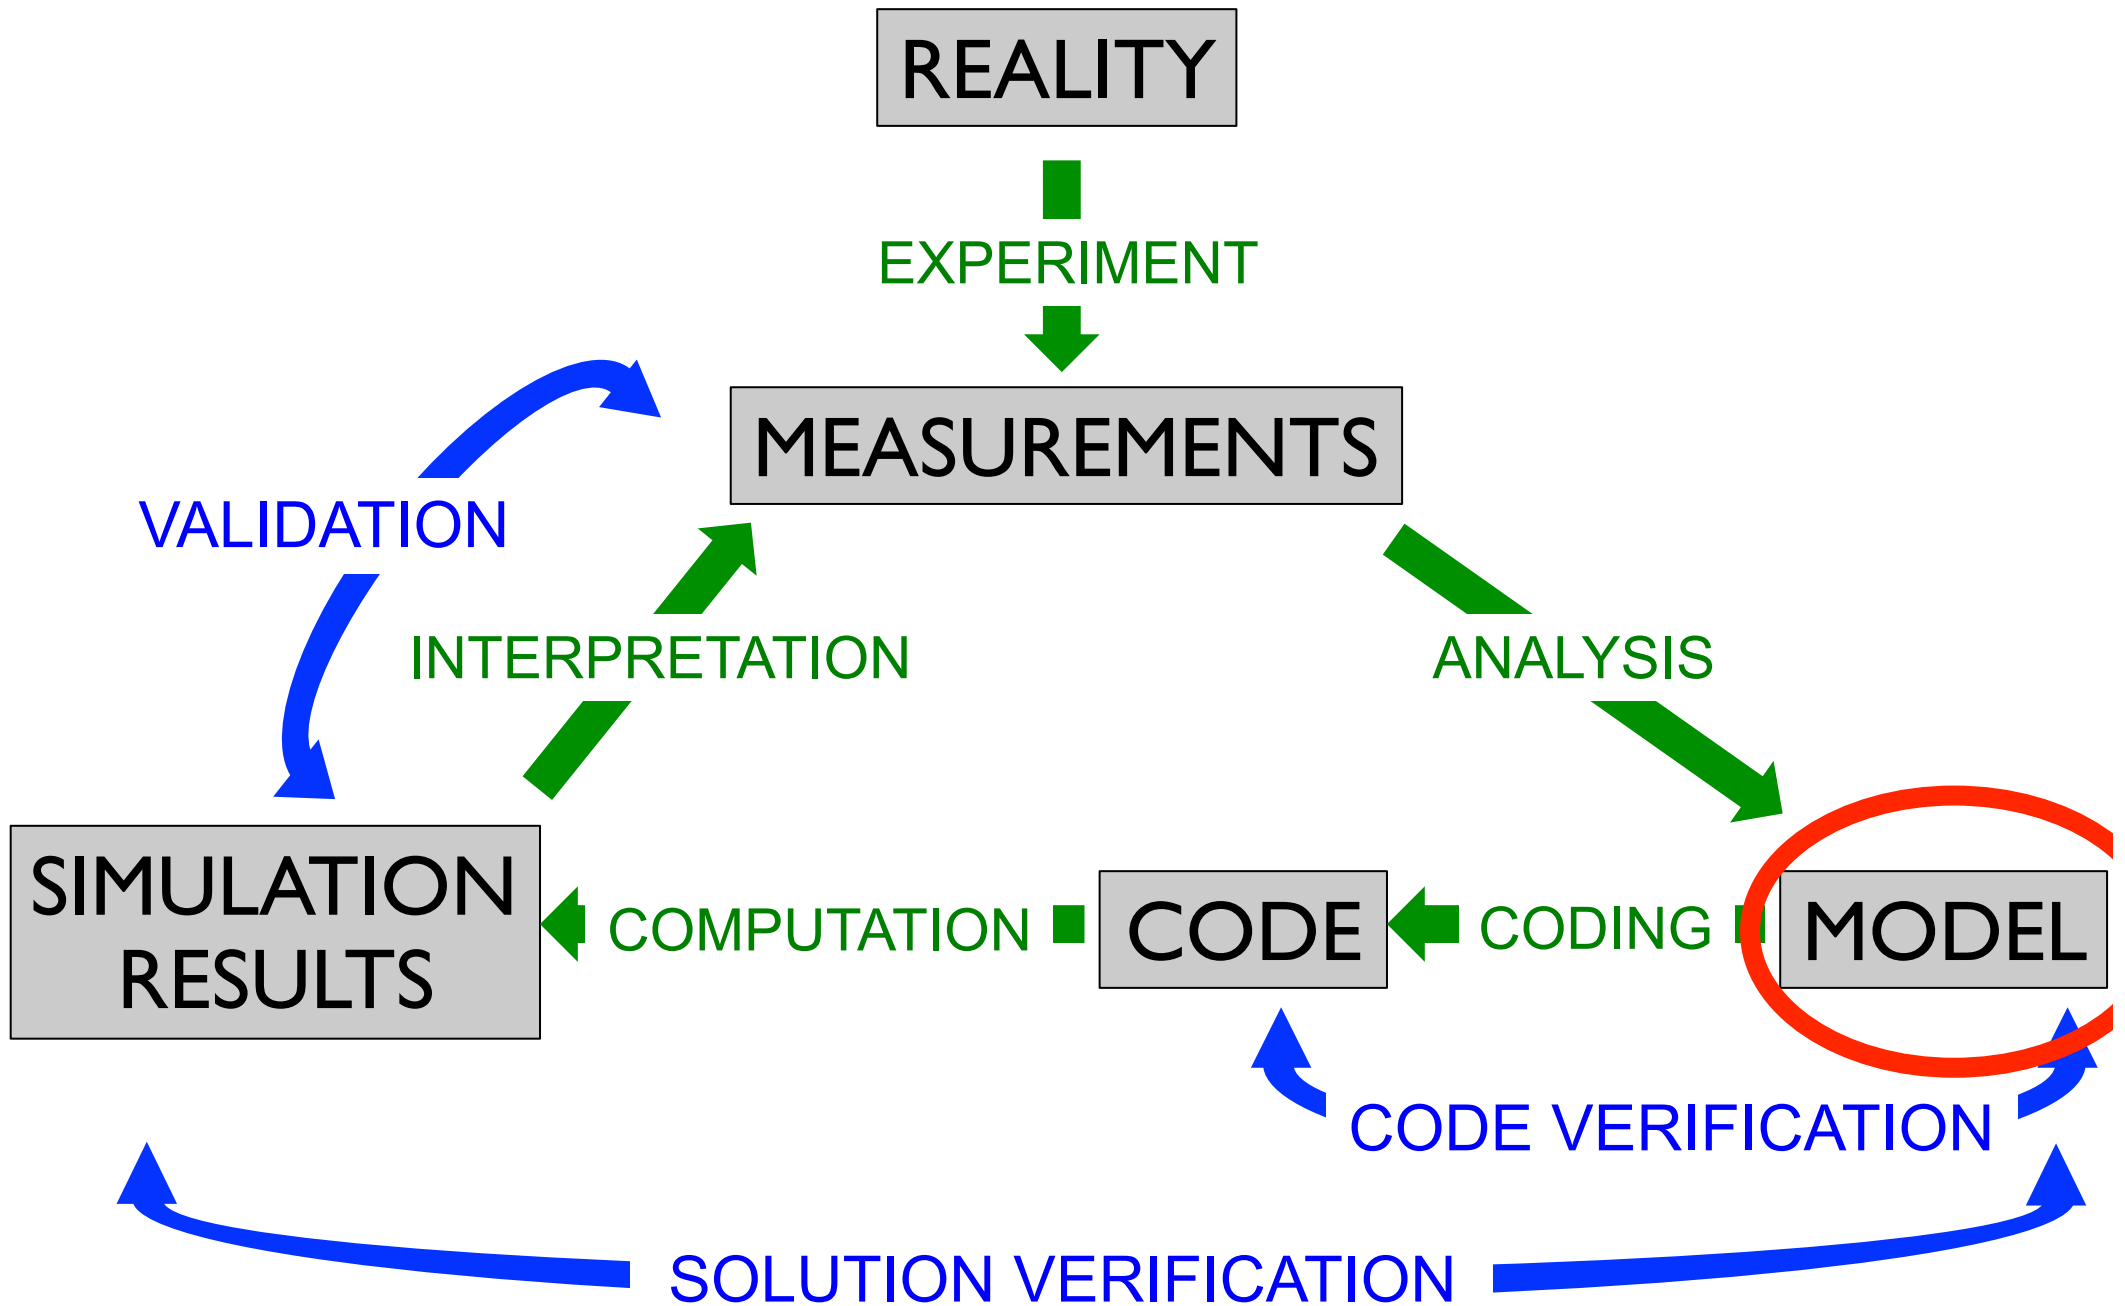

- Parameter scan,  $N$  – number of field line turns

Example:  $N=2$

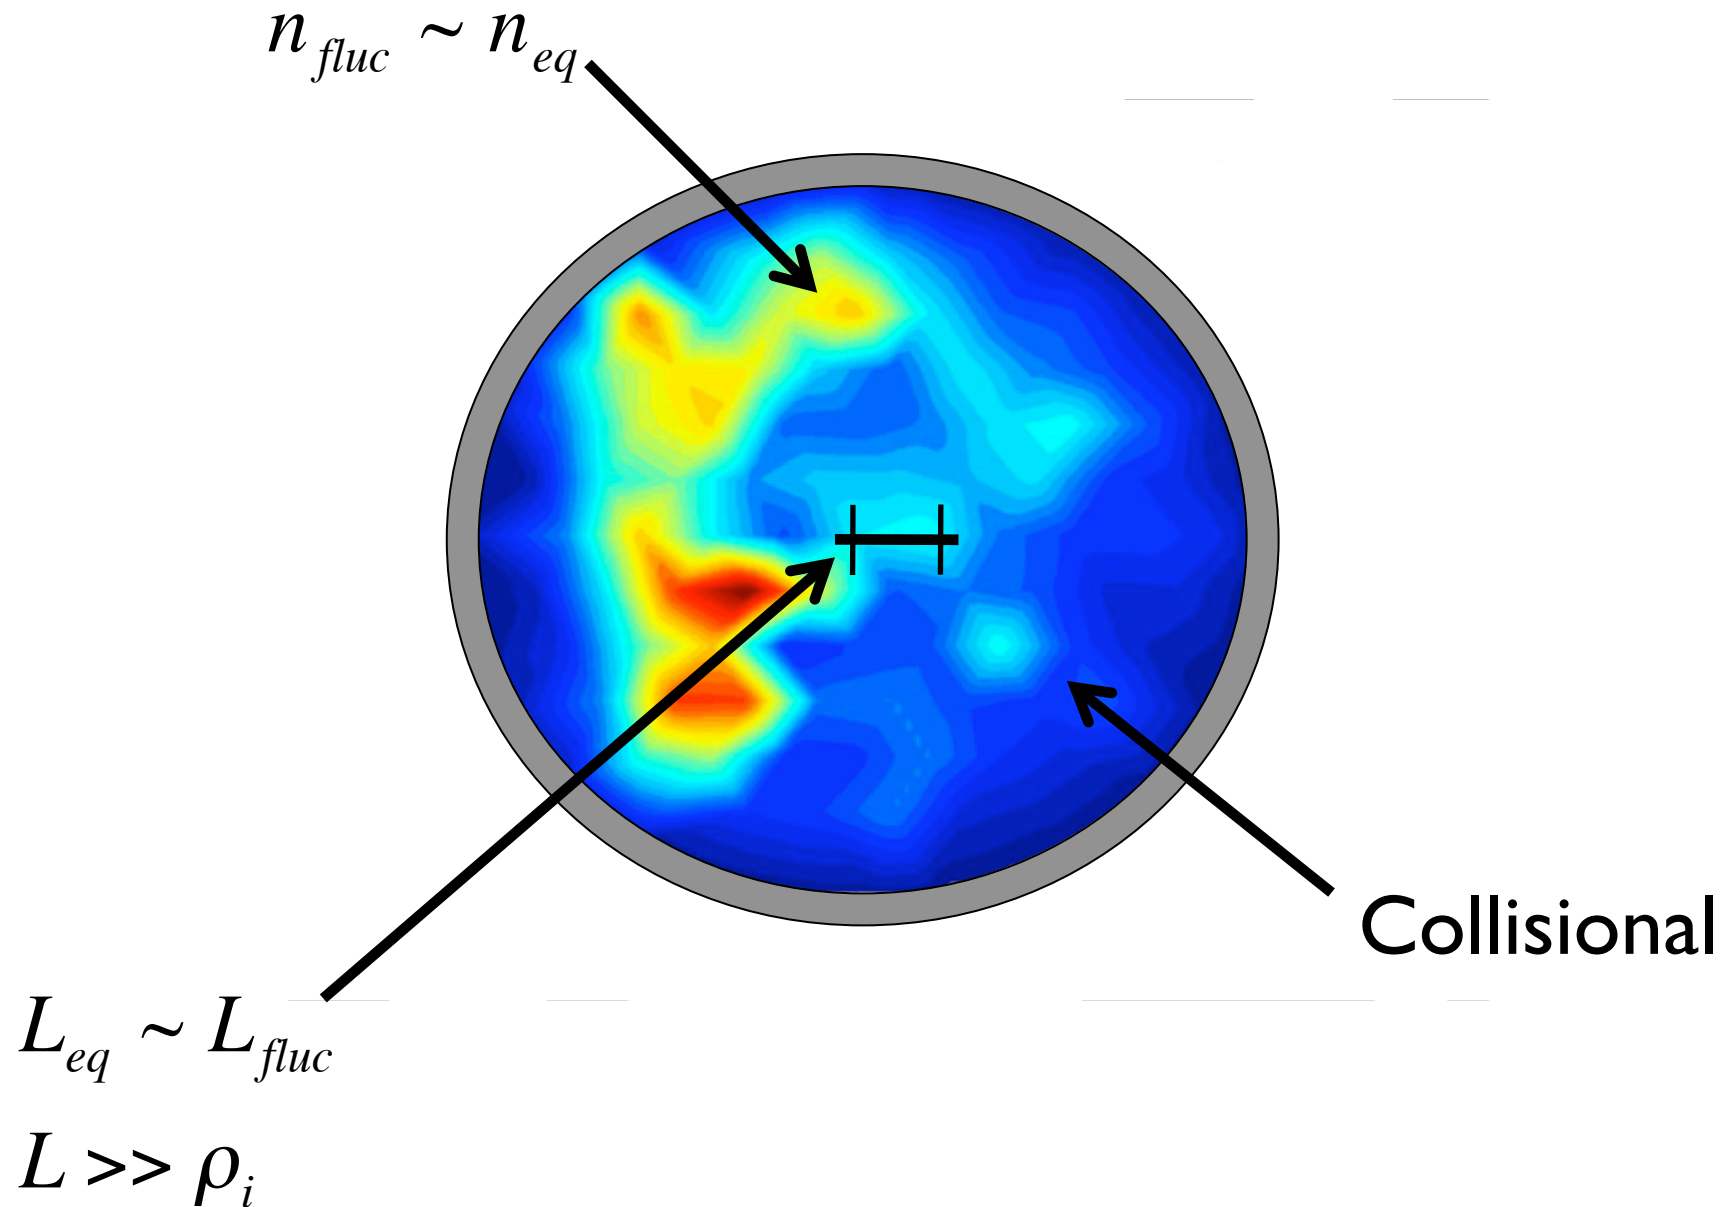

# Verification & Validation

---

# Properties of TORPEX turbulence

---

# The model

$$\frac{\partial n}{\partial t} + \overset{\text{ExB Convection}}{[\phi, n]} = \overset{\text{Magnetic curvature}}{\hat{C}(nT_e) - n\hat{C}(\phi)} - \overset{\text{Parallel dynamics}}{\nabla_{\parallel}(nV_{\parallel e})} + \overset{\text{Source}}{S}$$

$T_e, \Omega$  (vorticity)  $\rightarrow$  similar equations

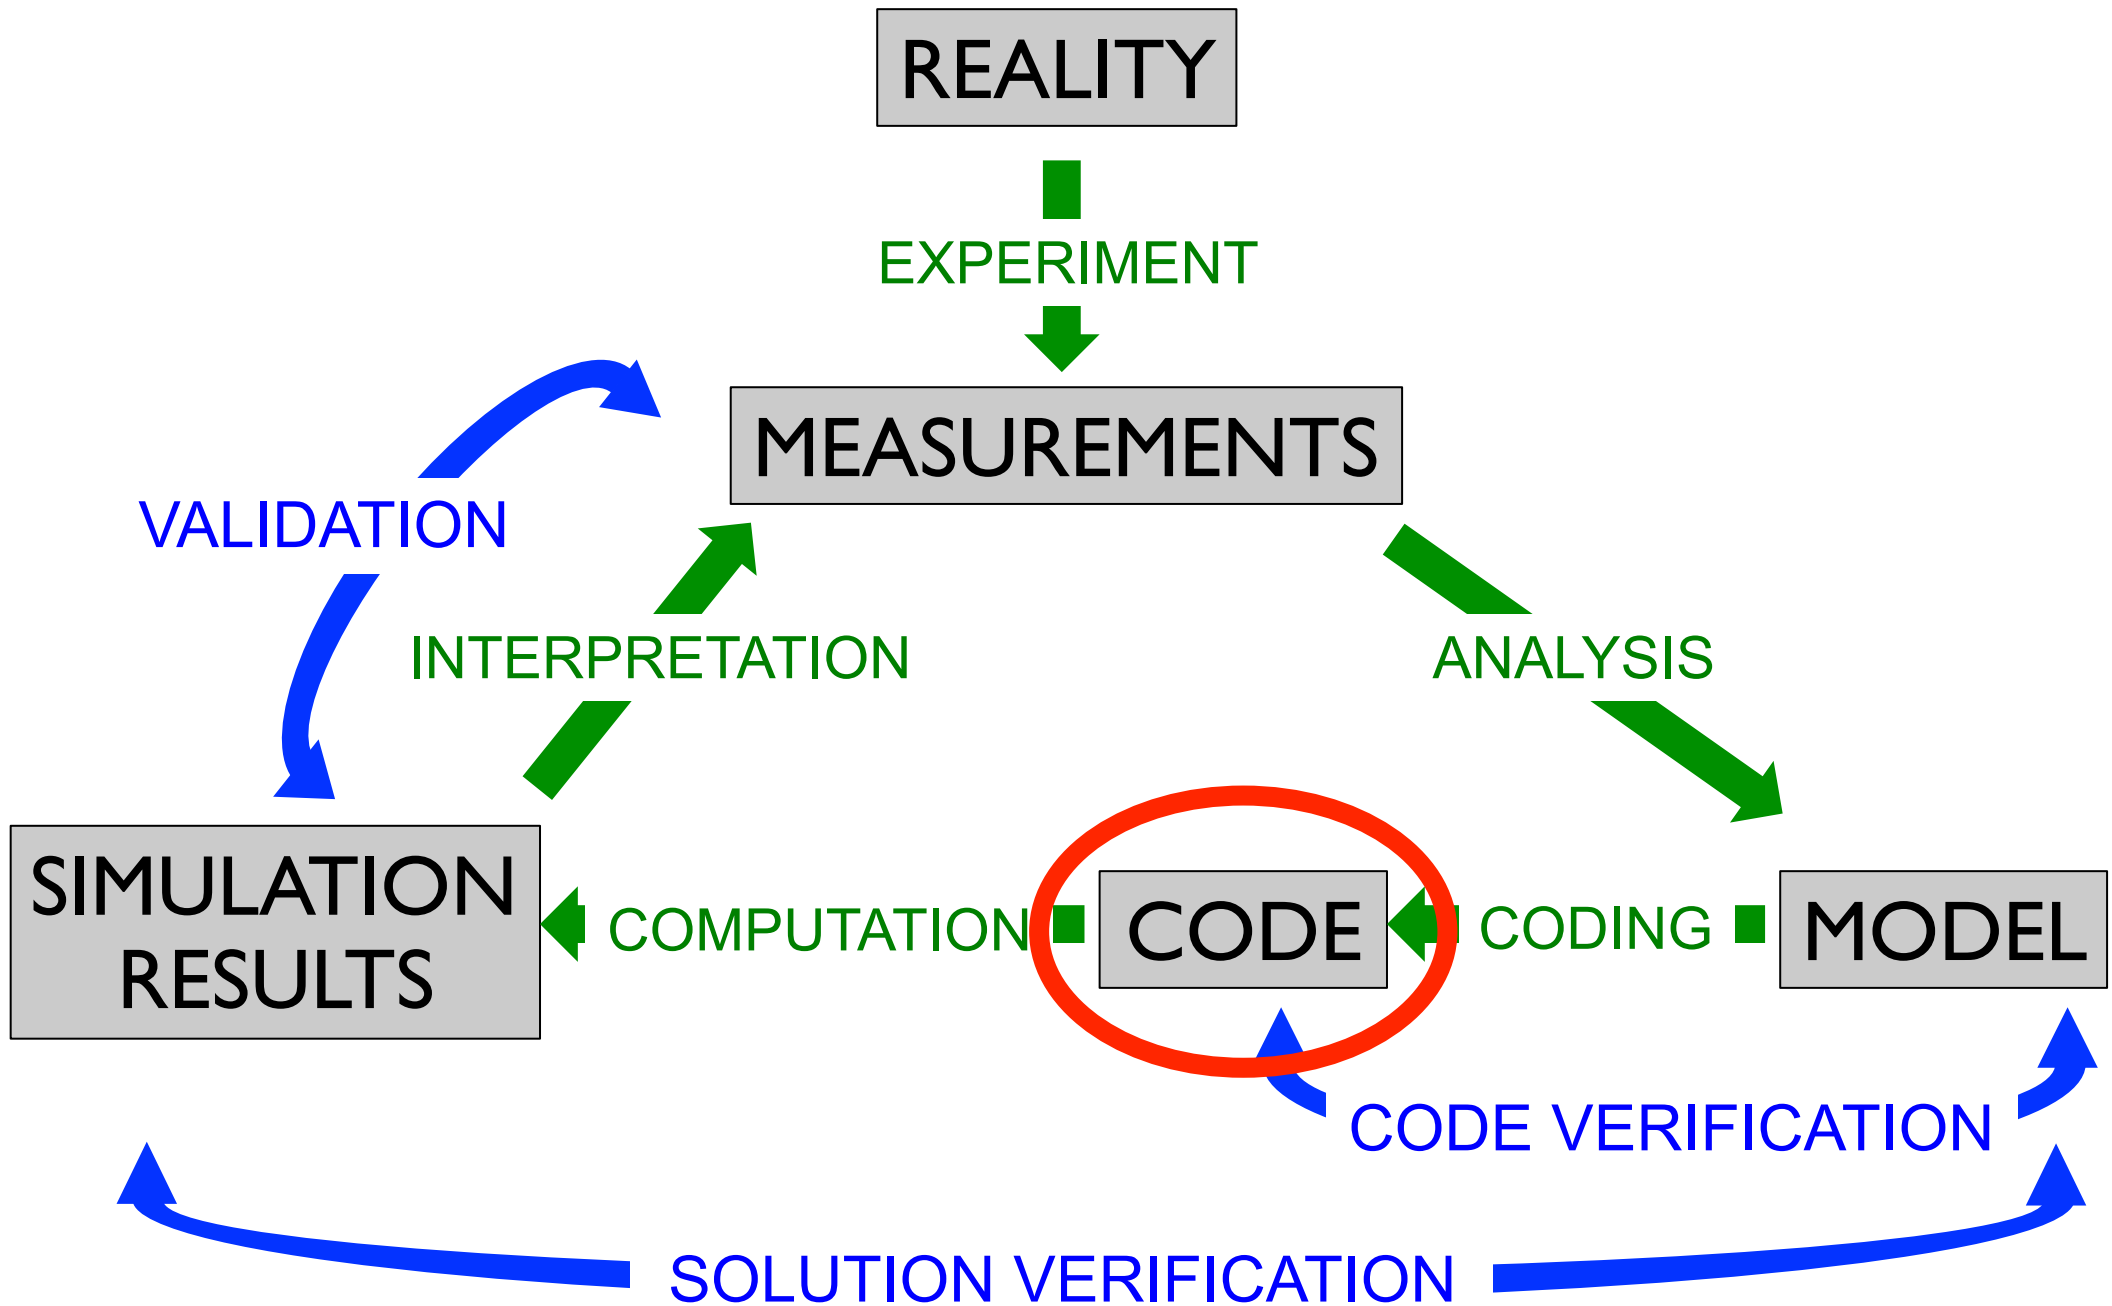

$V_{\parallel e}, V_{\parallel i}$   $\rightarrow$  parallel momentum balance

$$\nabla_{\perp}^2 \phi = \Omega$$

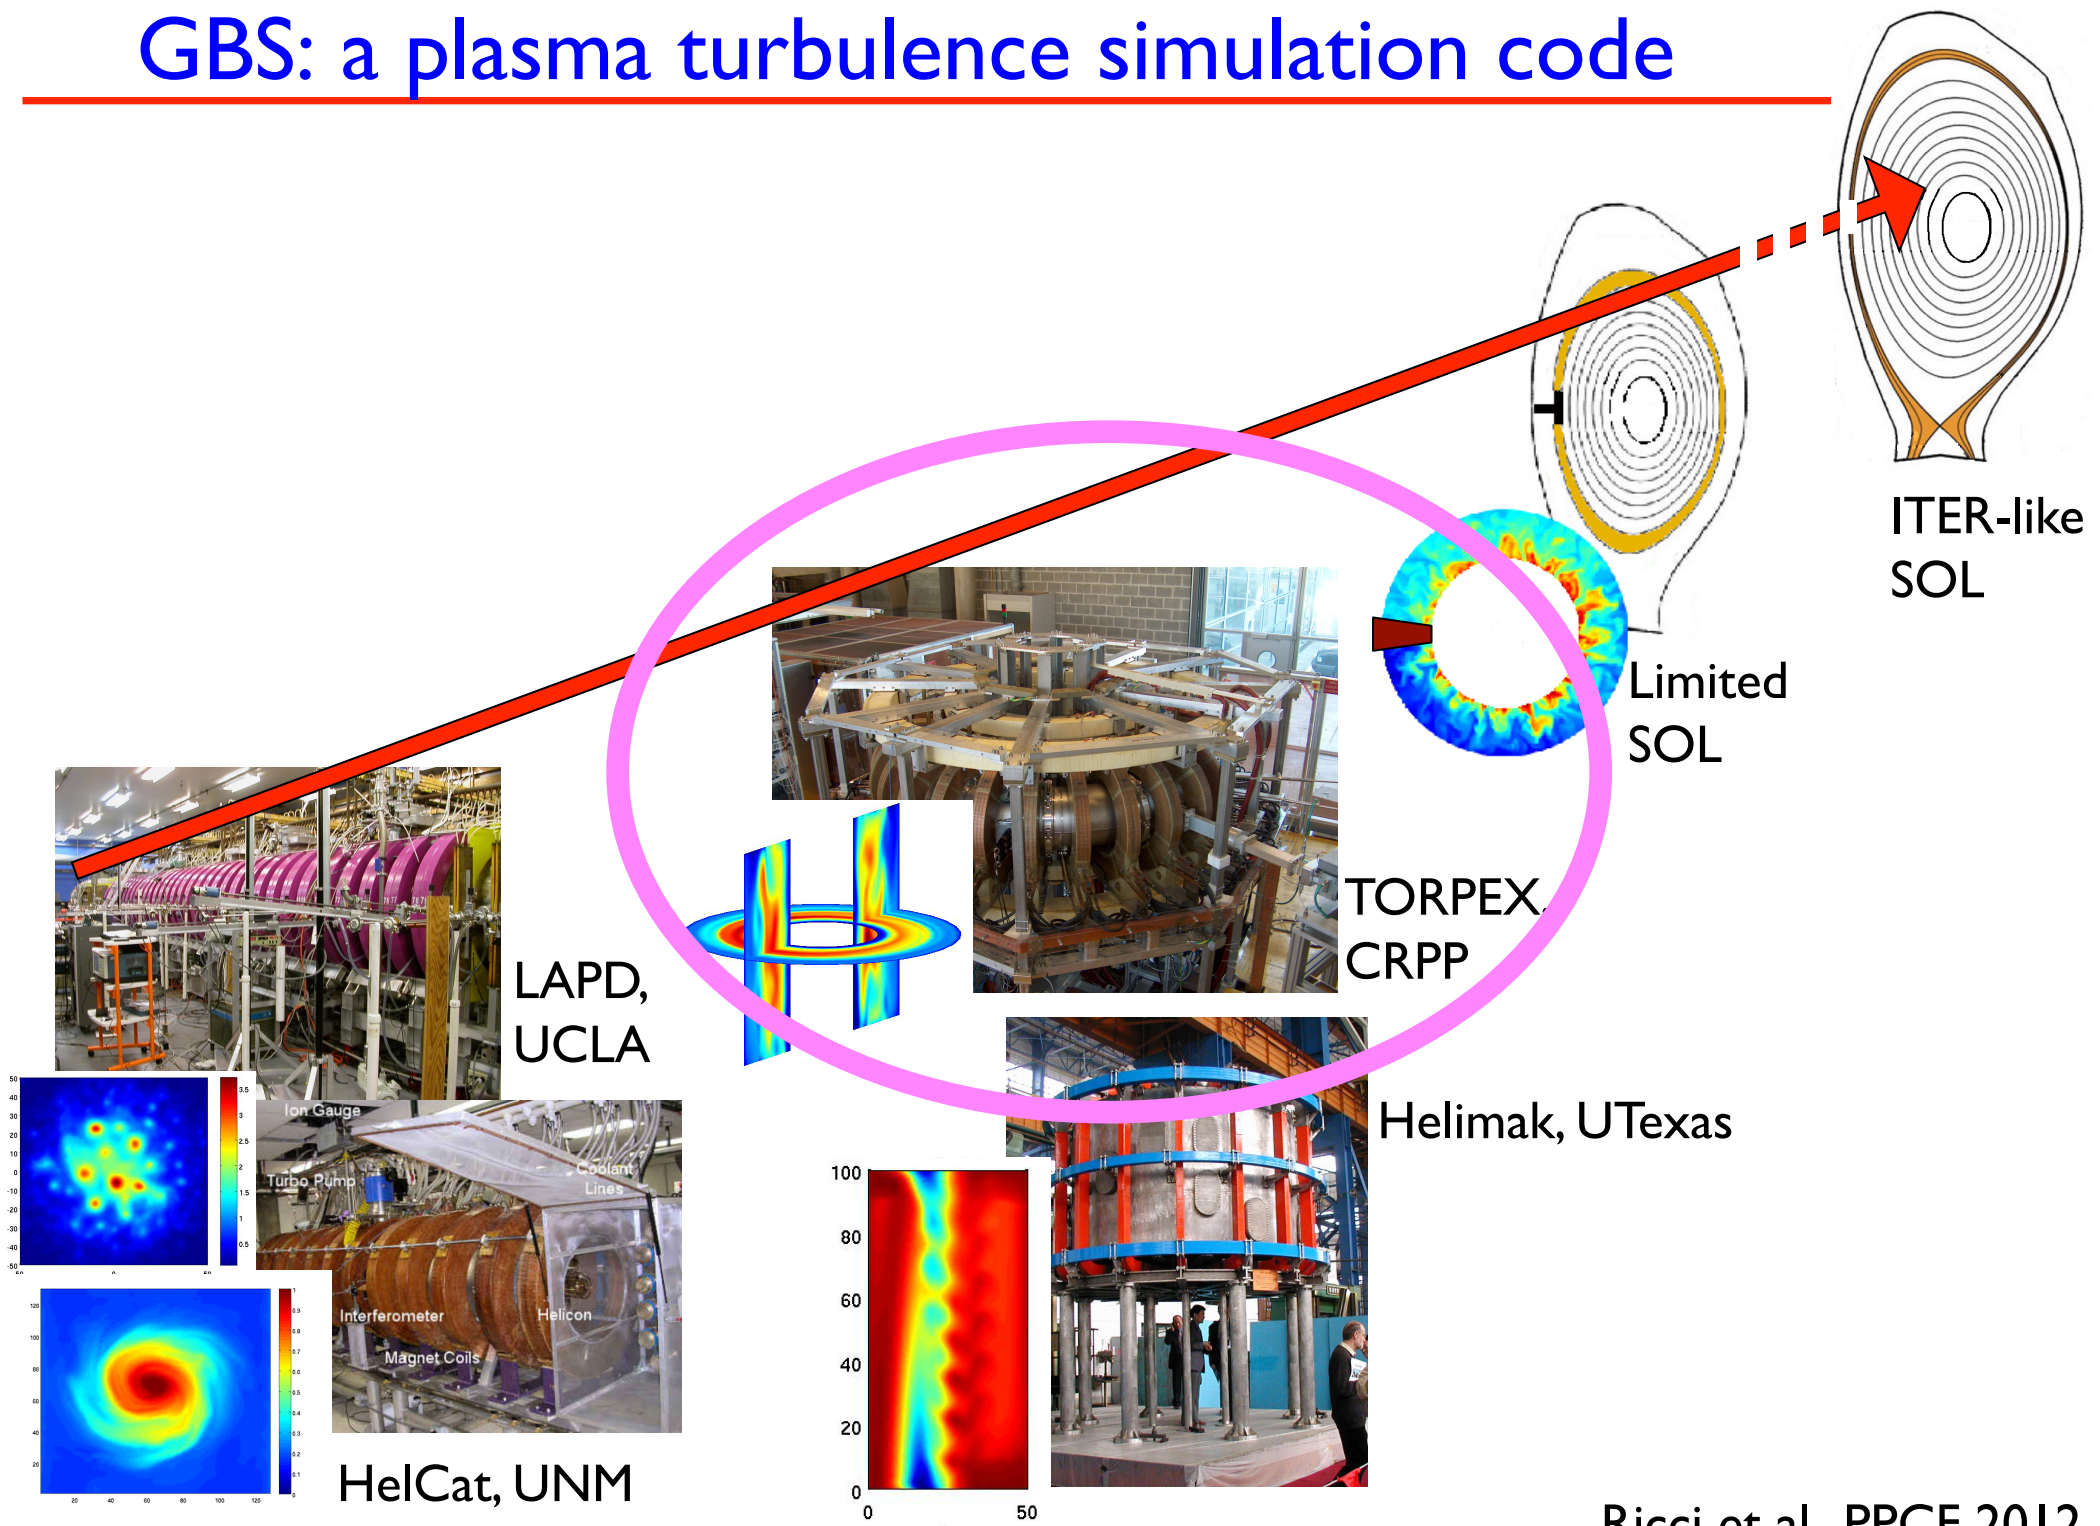

Quasi steady state – balance between:  
plasma source, perpendicular transport, and parallel losses

# Verification & Validation

---

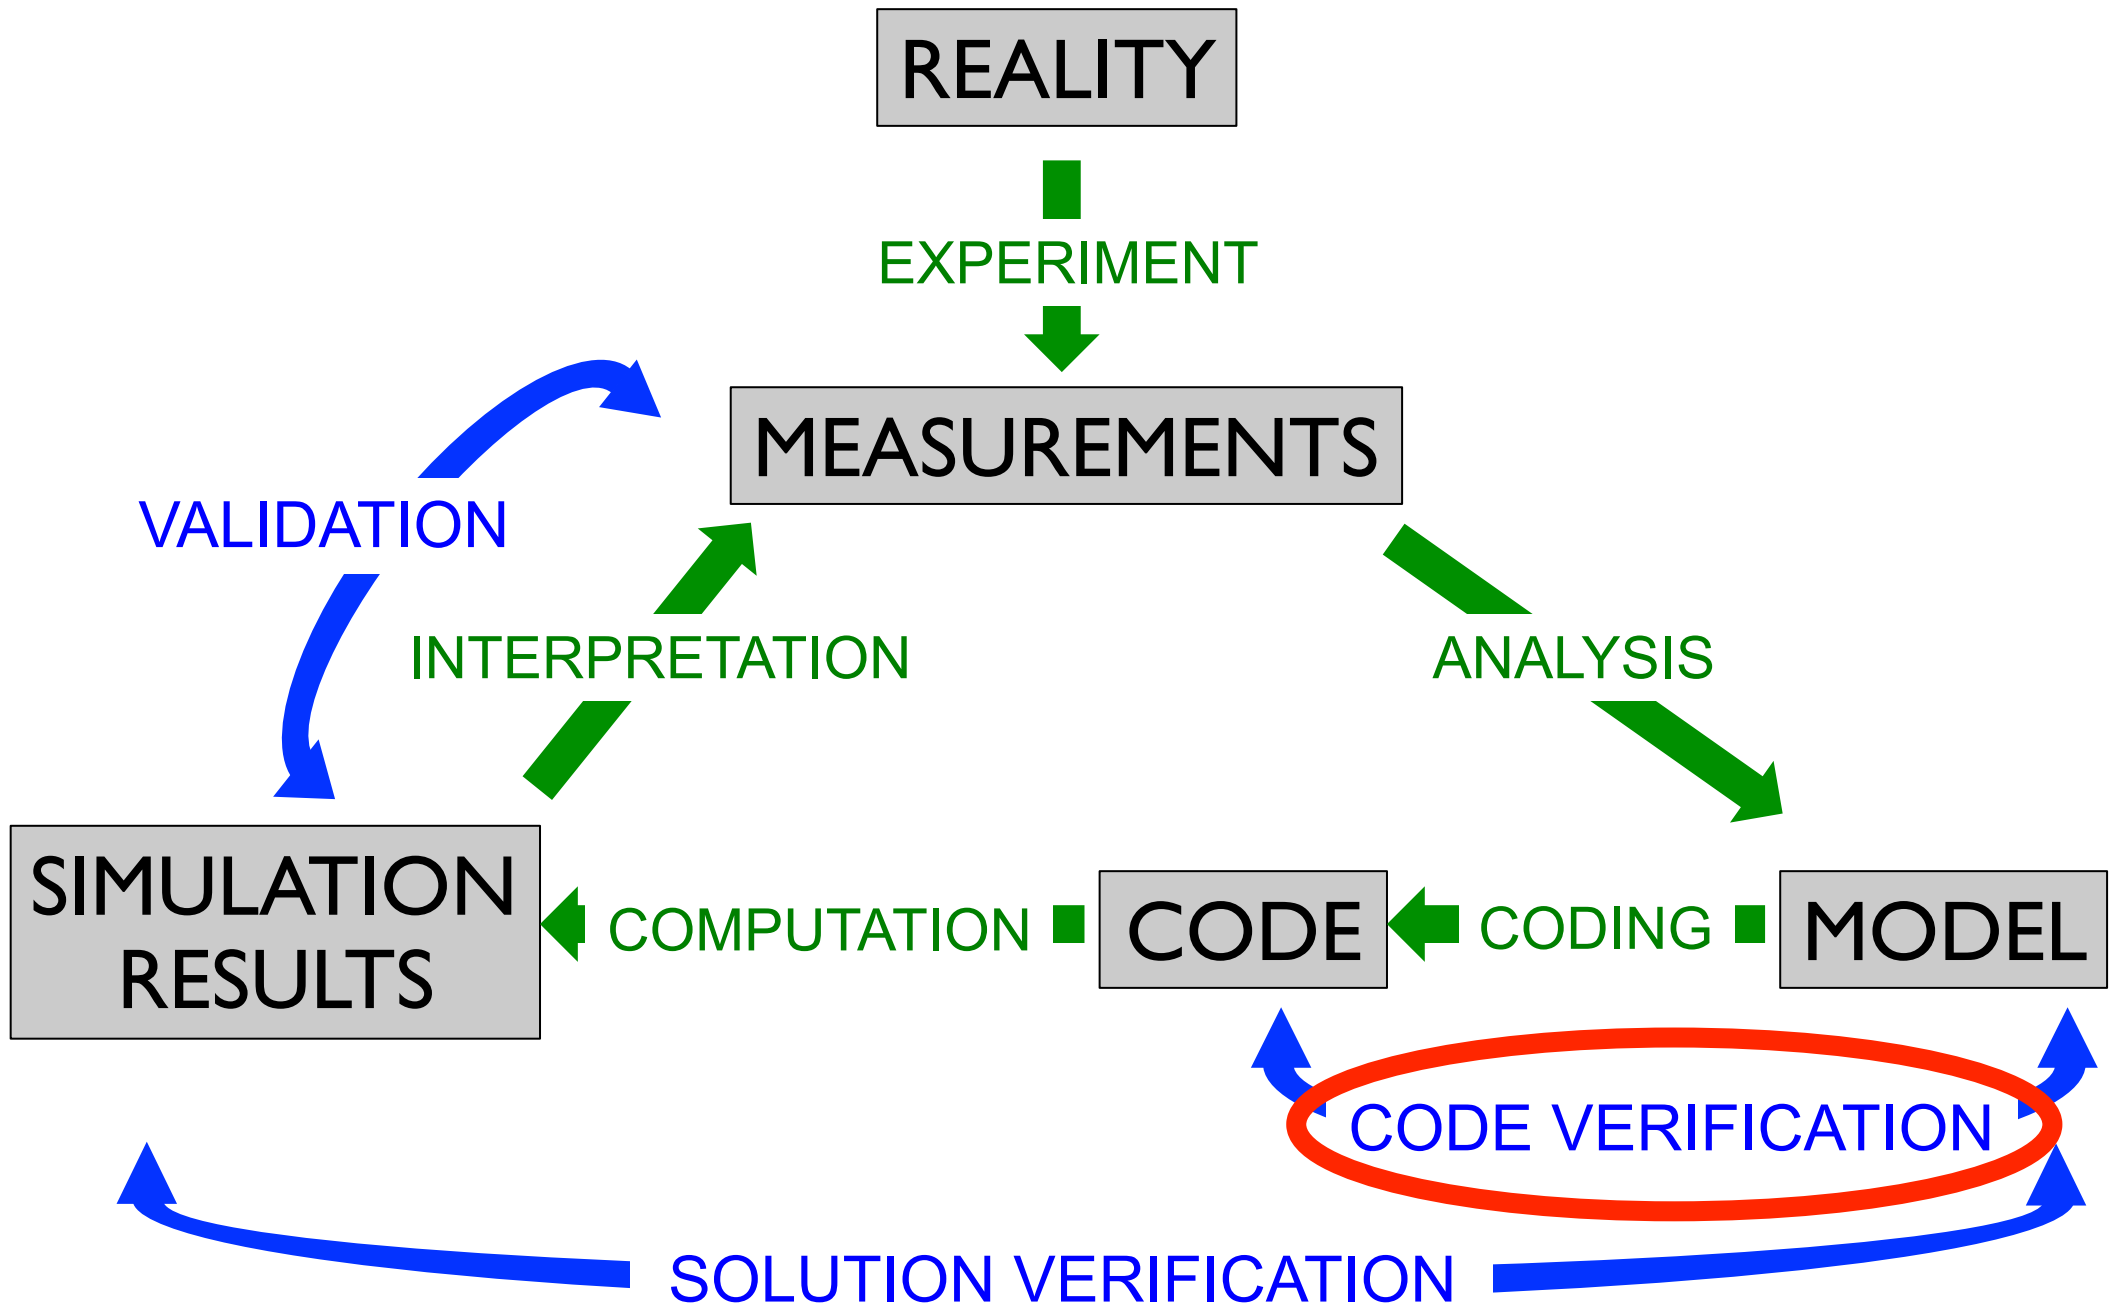

# GBS: a plasma turbulence simulation code

# Verification & Validation

---

# Code verification, the techniques

---

- 1) Simple tests
- 2) Code-to-code comparisons (benchmarking)
- 3) Discretization error quantification
- 4) Convergence tests
- 5) Order-of-accuracy tests

NOT  
RIGOROUS

RIGOROUS,  
requires  
analytical  
solution

Only verification ensuring  
convergence and correct  
numerical implementation

# Order-of-accuracy tests, method of manufactured solution

Our model:  $A(f) = 0$ ,  $f$  unknown

We solve  $A_n(f_n) = 0$ , but  $\epsilon_n = f_n - f = ?$

## Method of manufactured solution:

1) we choose  $g$ , then  $S = A(g)$

2) we solve:  $A_n(g_n) - S = 0$

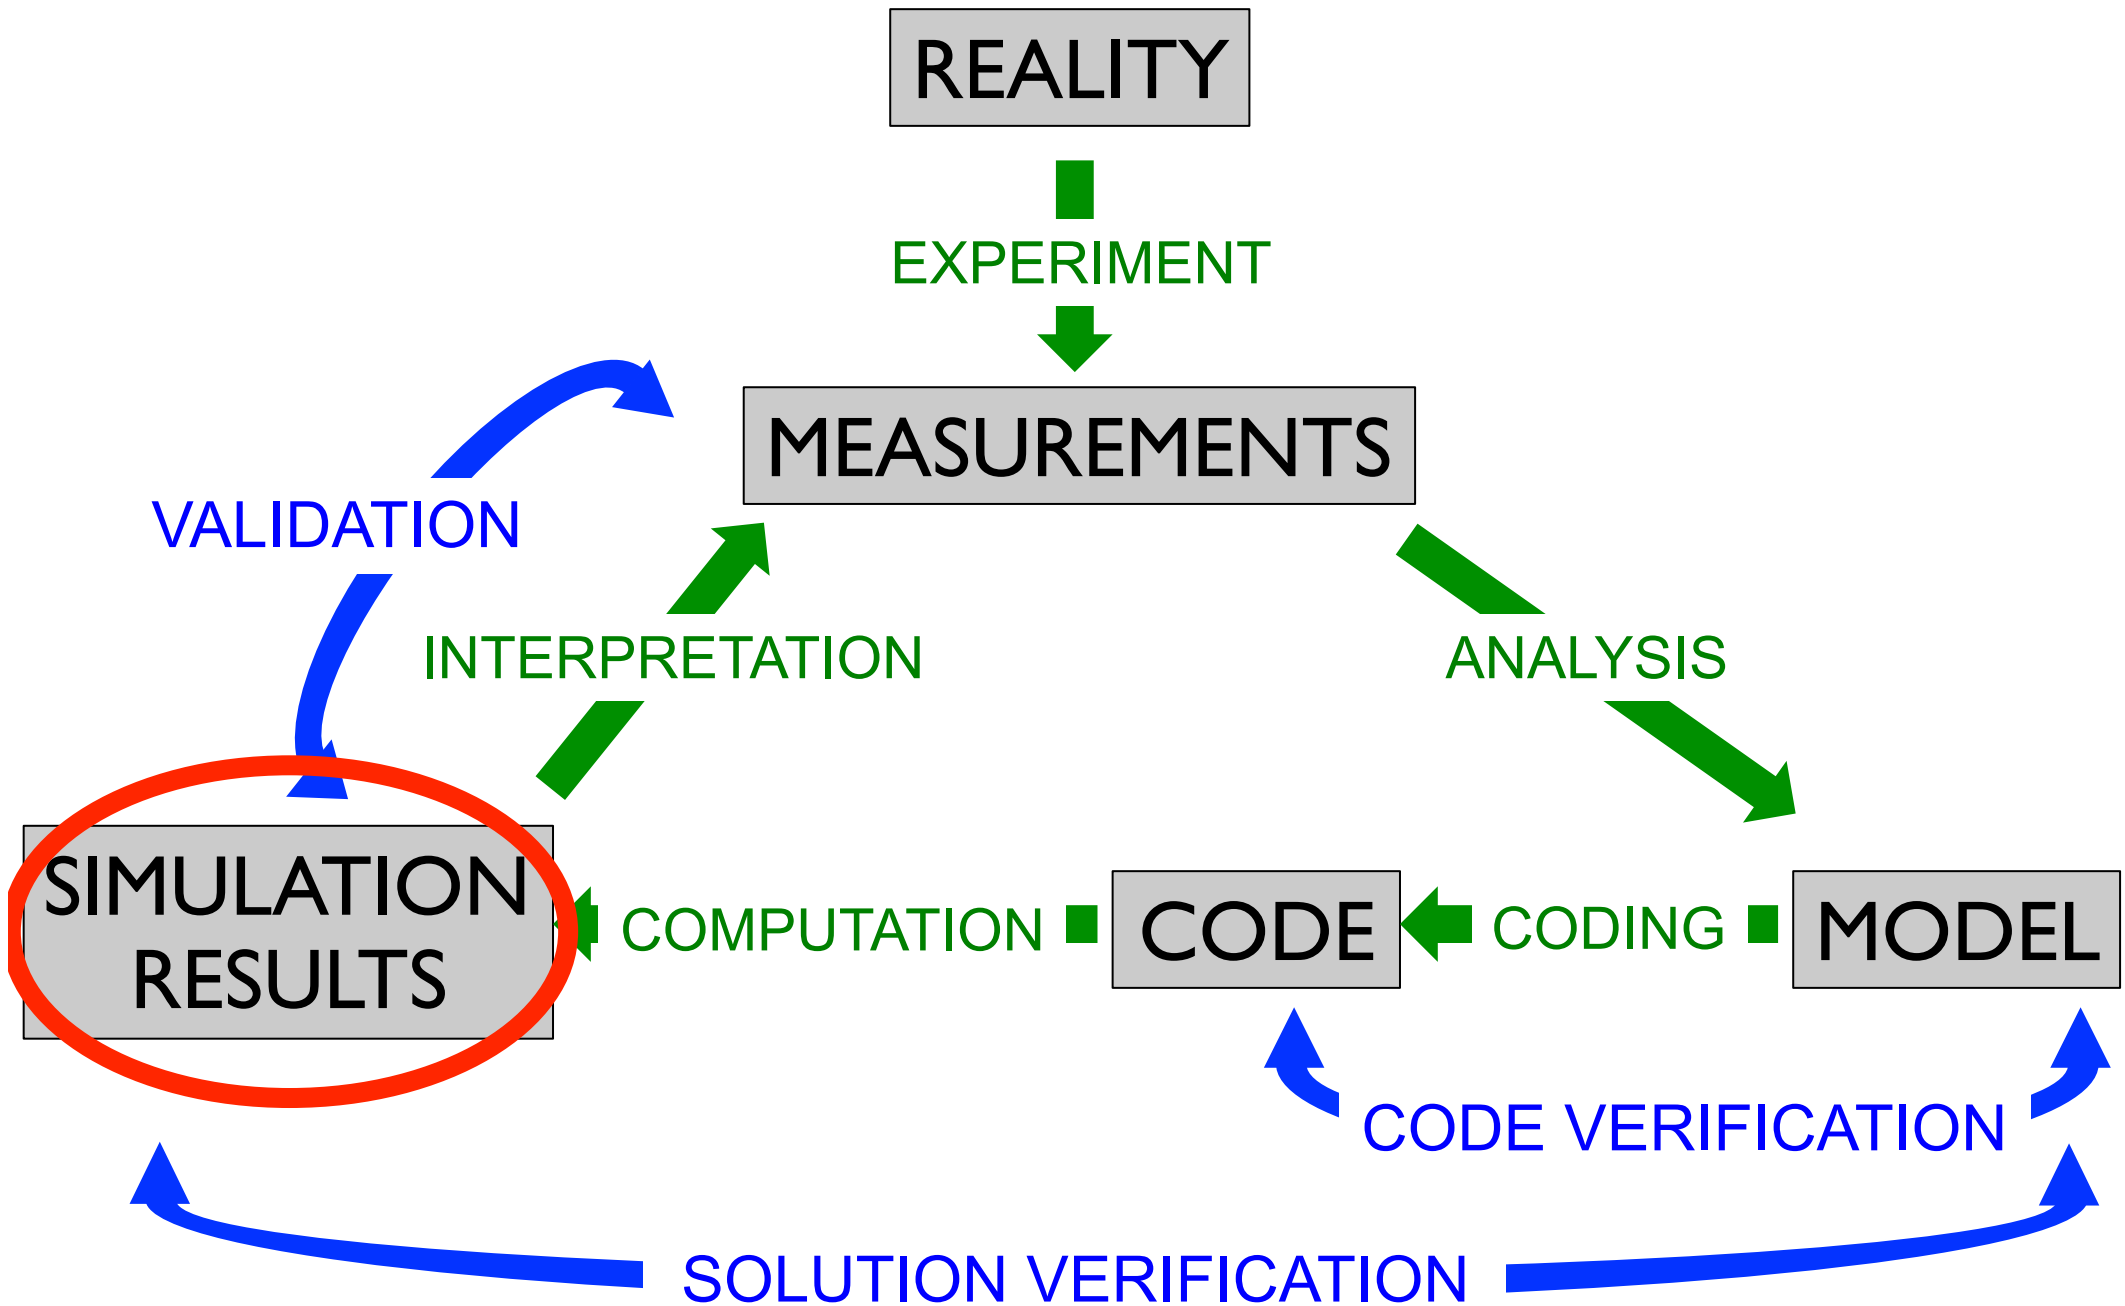

$$\epsilon_n = g_n - g$$

For GBS:

# Verification & Validation

---

# 3D and 2D GBS simulations

---

Fully 3D version

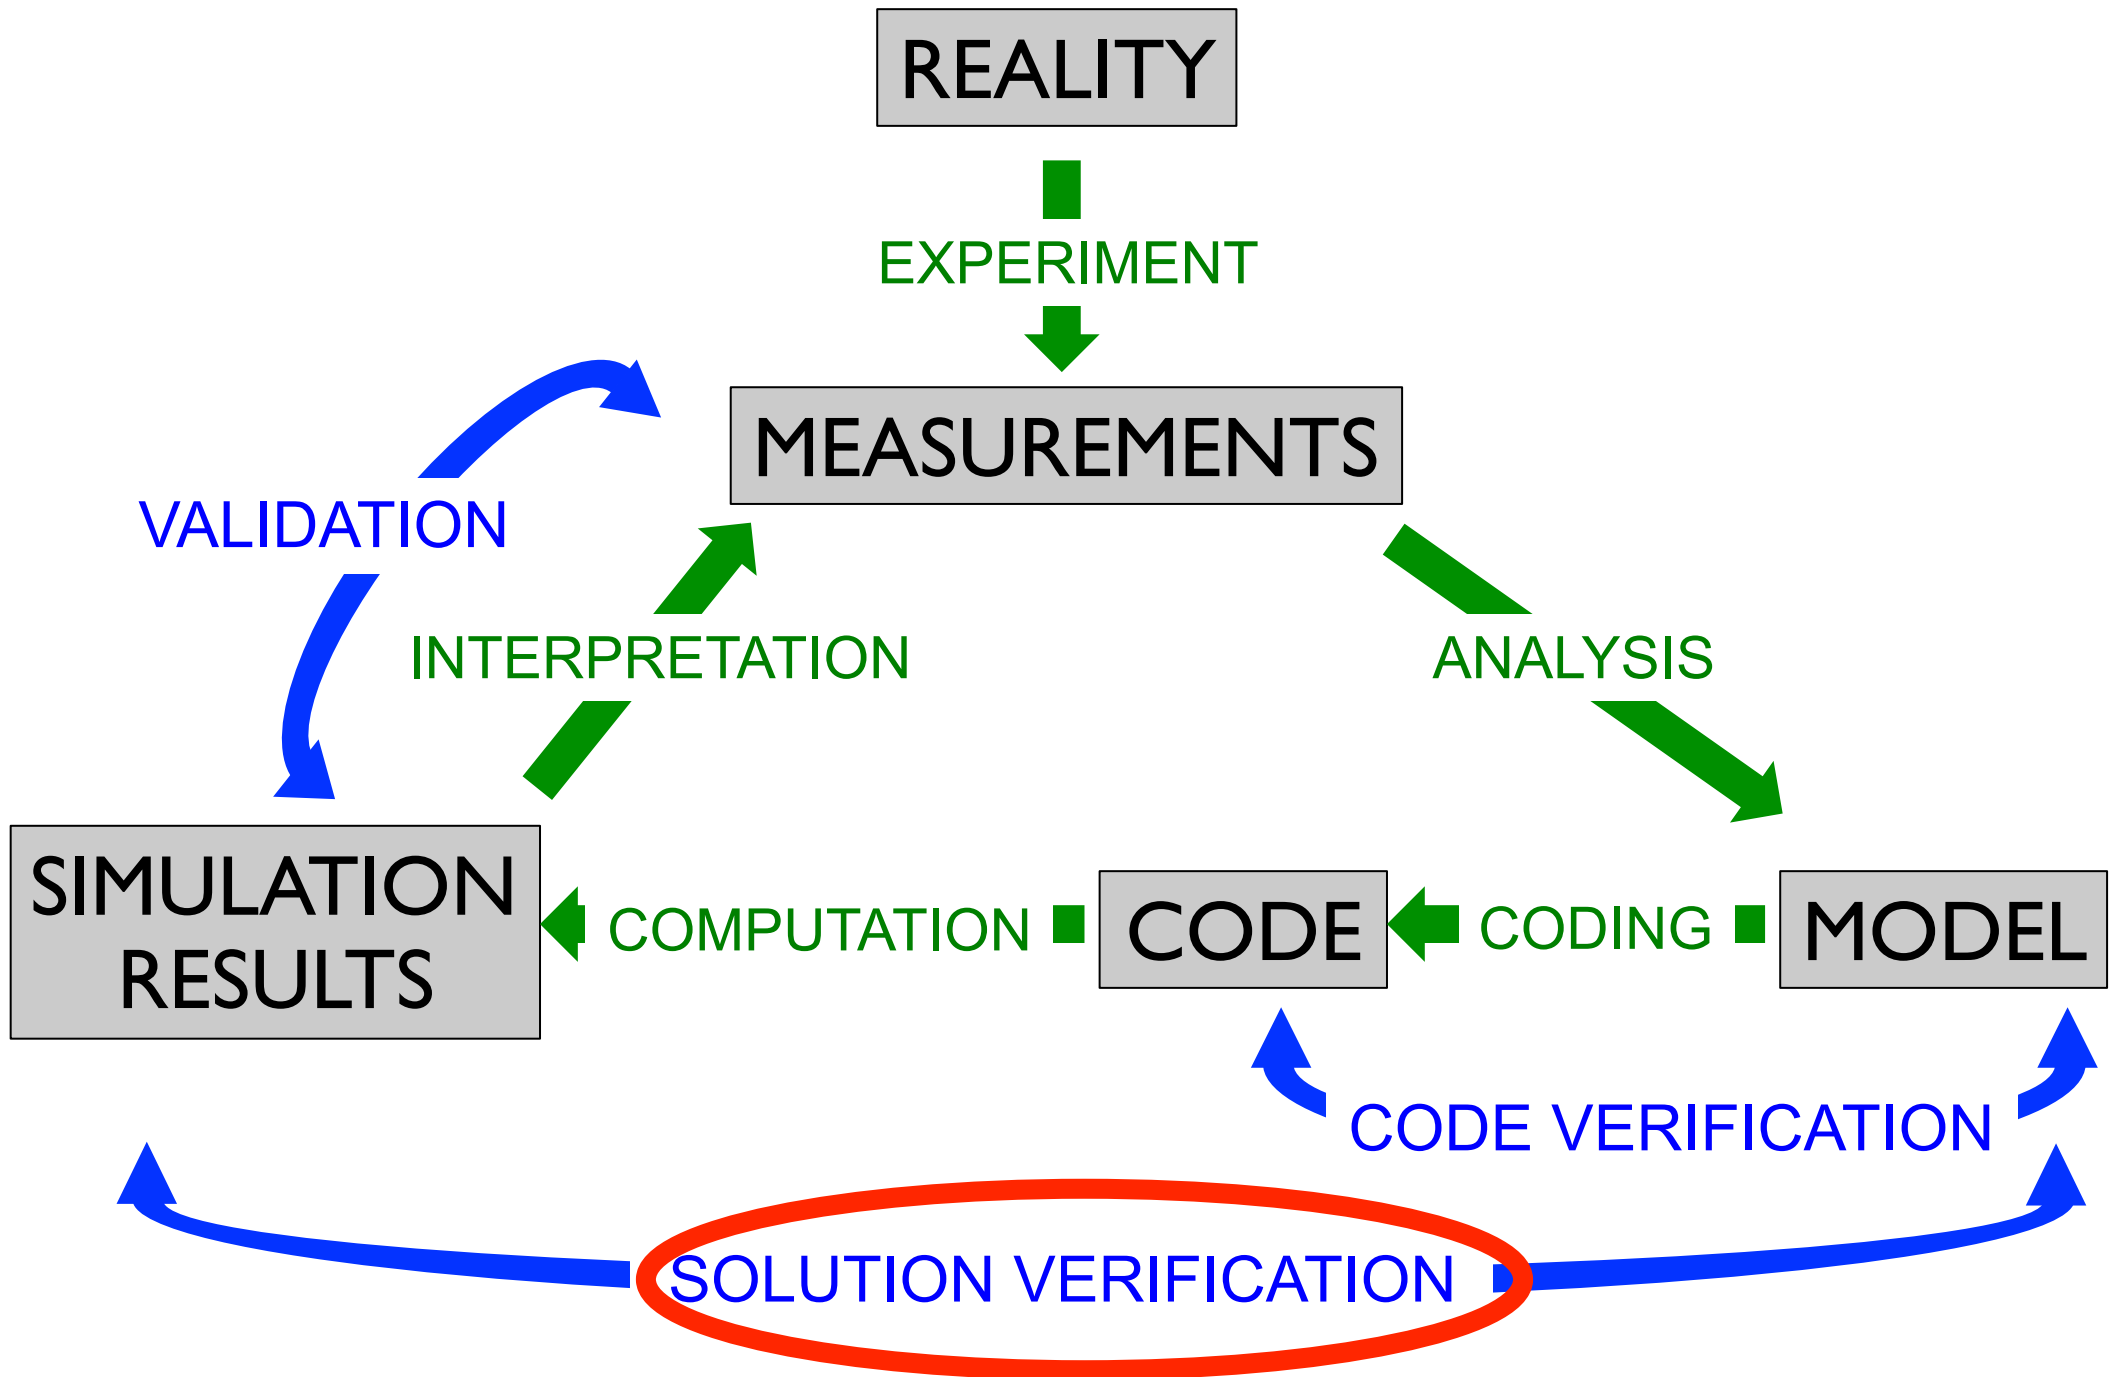

2D version ( $k_{||}=0$  hypothesis)

# Verification & Validation

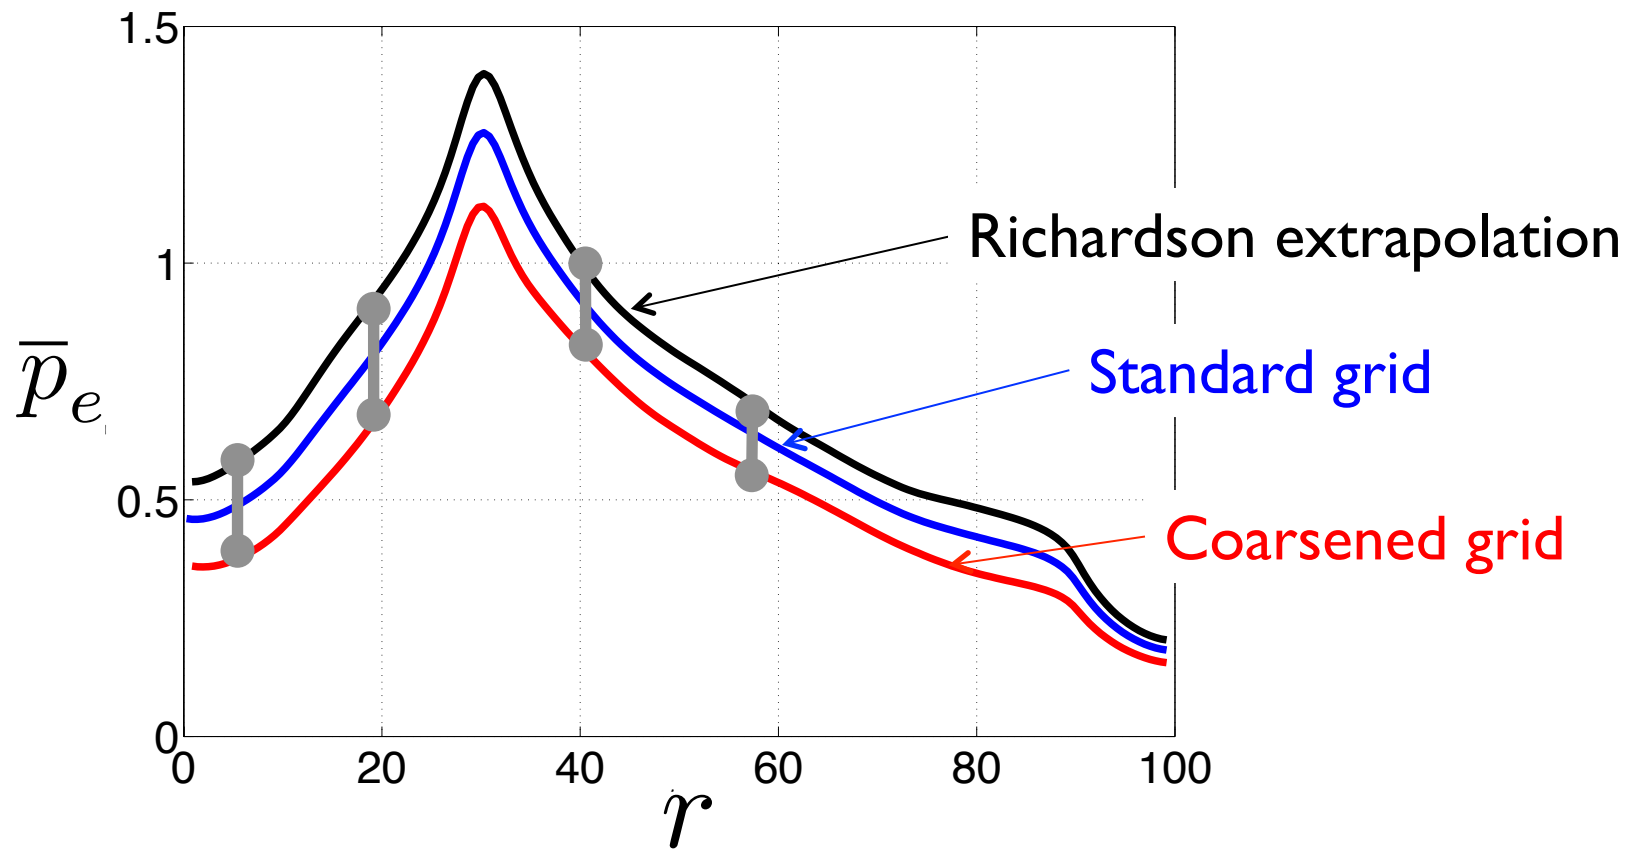

---

# Solution verification, Richardson extrapolation

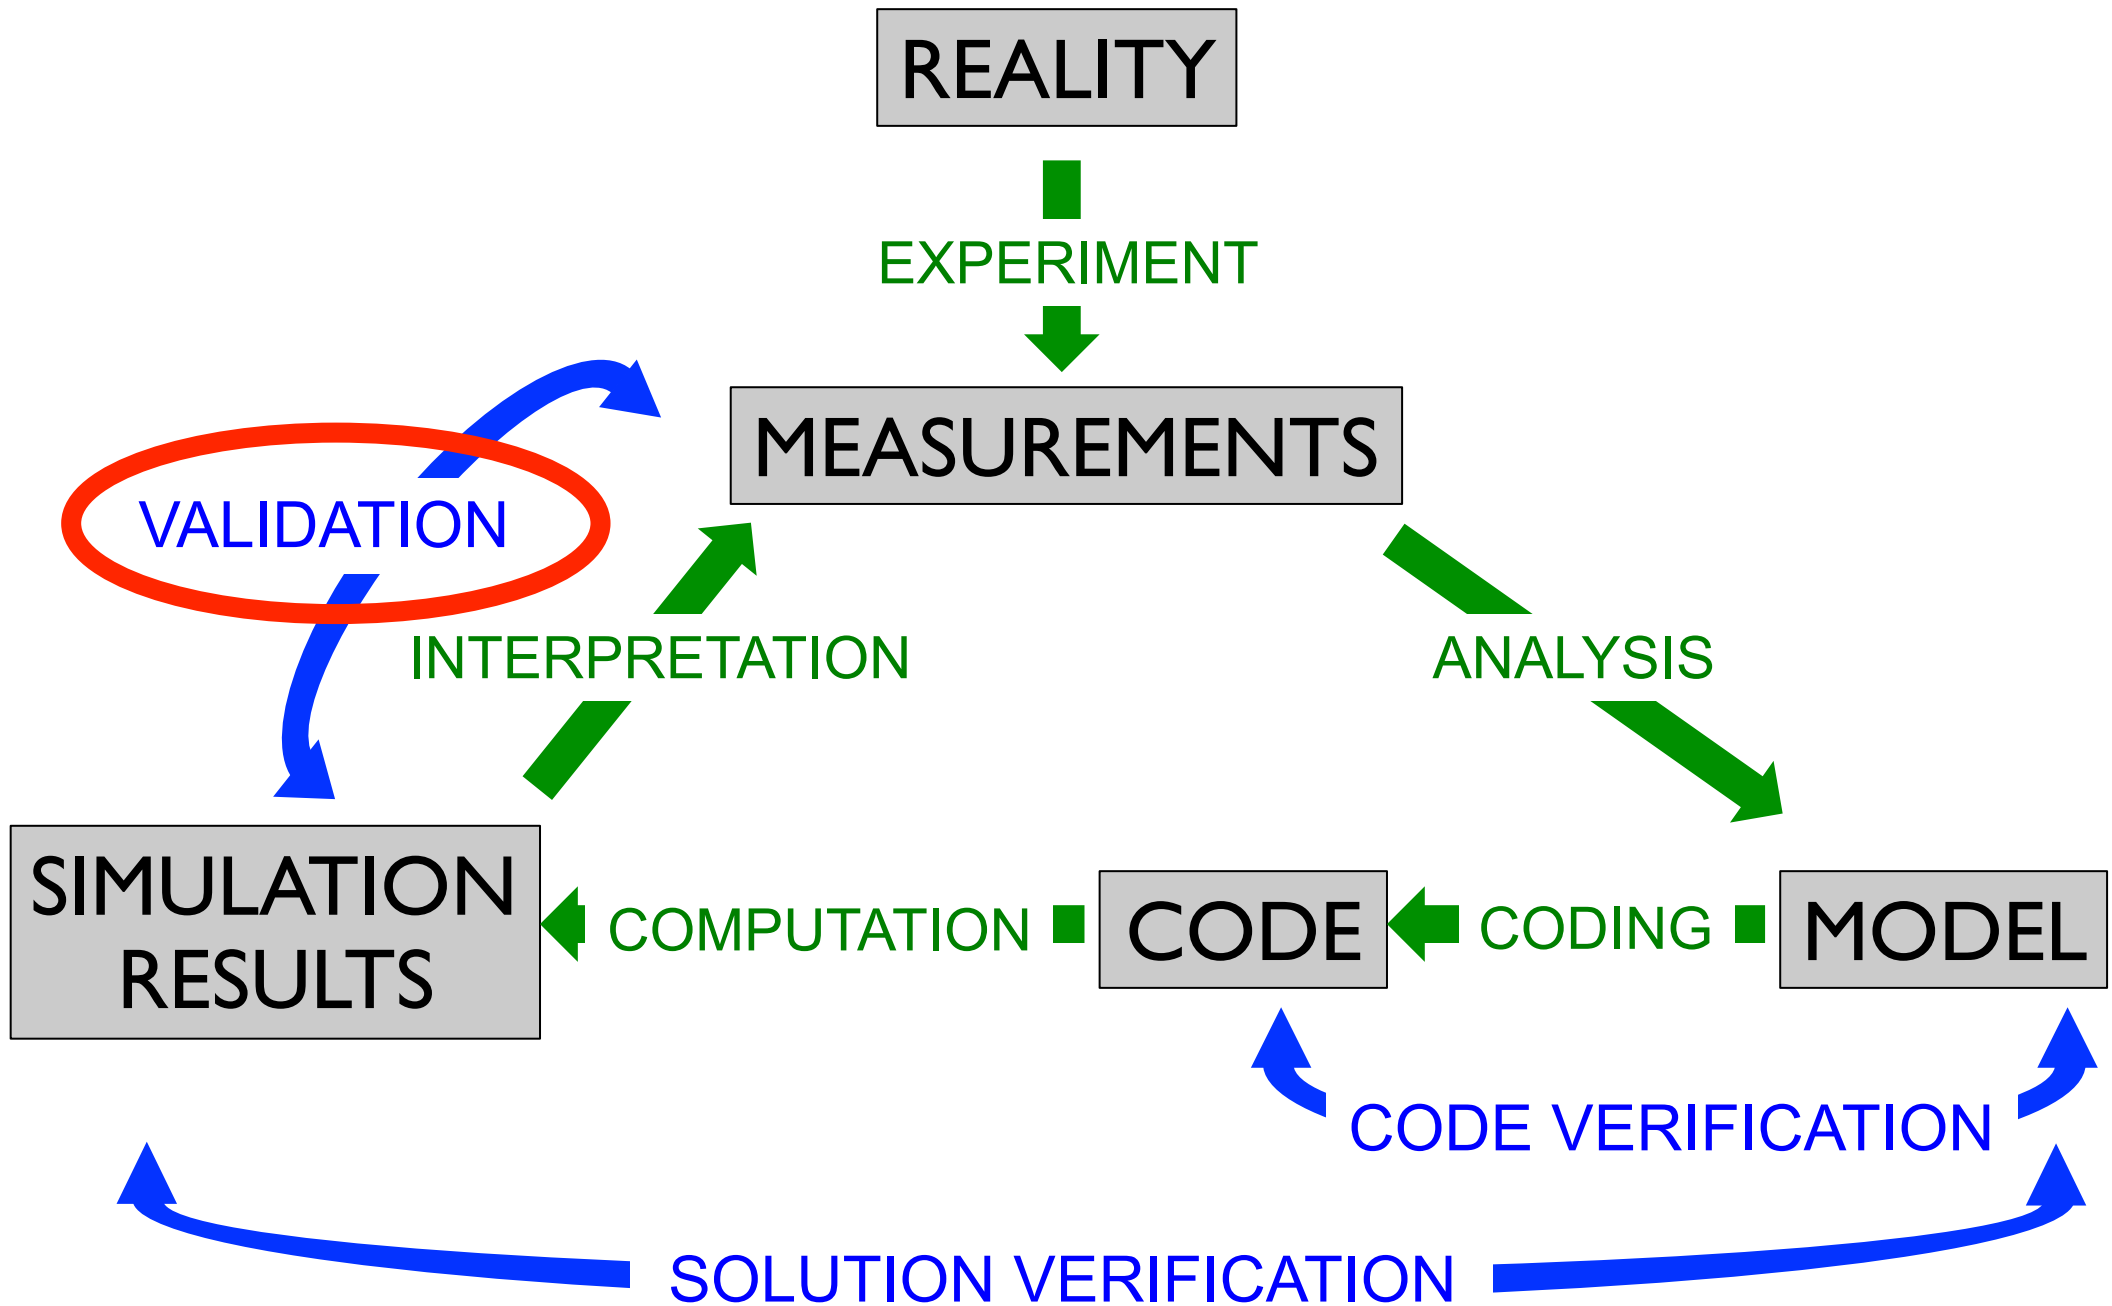

# Solution verification, Richardson extrapolation

Use Roache's GCI error estimate if far from convergence

# Verification & Validation

---

# Validation goals

---

- Make progress in physics understanding
- Compare experiments and simulations to assess physics of the model
- Consider different models and parameter scans to guide us to key physics

- Avoid fortuitous agreement
- Rigorous tool, but easy to use

# Our project, paradigm of turbulence code validation

---

- For the 2 codes, what is the agreement of experiment and simulations as a function of  $N$ ?
- Are 3D effects important? Role of 3D in TORPEX physics?

# The validation methodology

---

*What quantities can we use for validation? The more, the better...*

- **Definition & evaluation of the validation observables**

*What are the uncertainties affecting measured and simulation data?*

- **Uncertainty analysis**

*For one observable, within its uncertainties, what is the level of agreement?*

- **Level of agreement for an individual observable**

*How directly can an observable be extracted from simulation and experimental data? How worthy is it, i.e. what should be its weight in a composite metric?*

- **The observable hierarchy**

*How to evaluate the global agreement and how to interpret it*

- **Composite metric**

# Definition of the validation observables

Common quantities

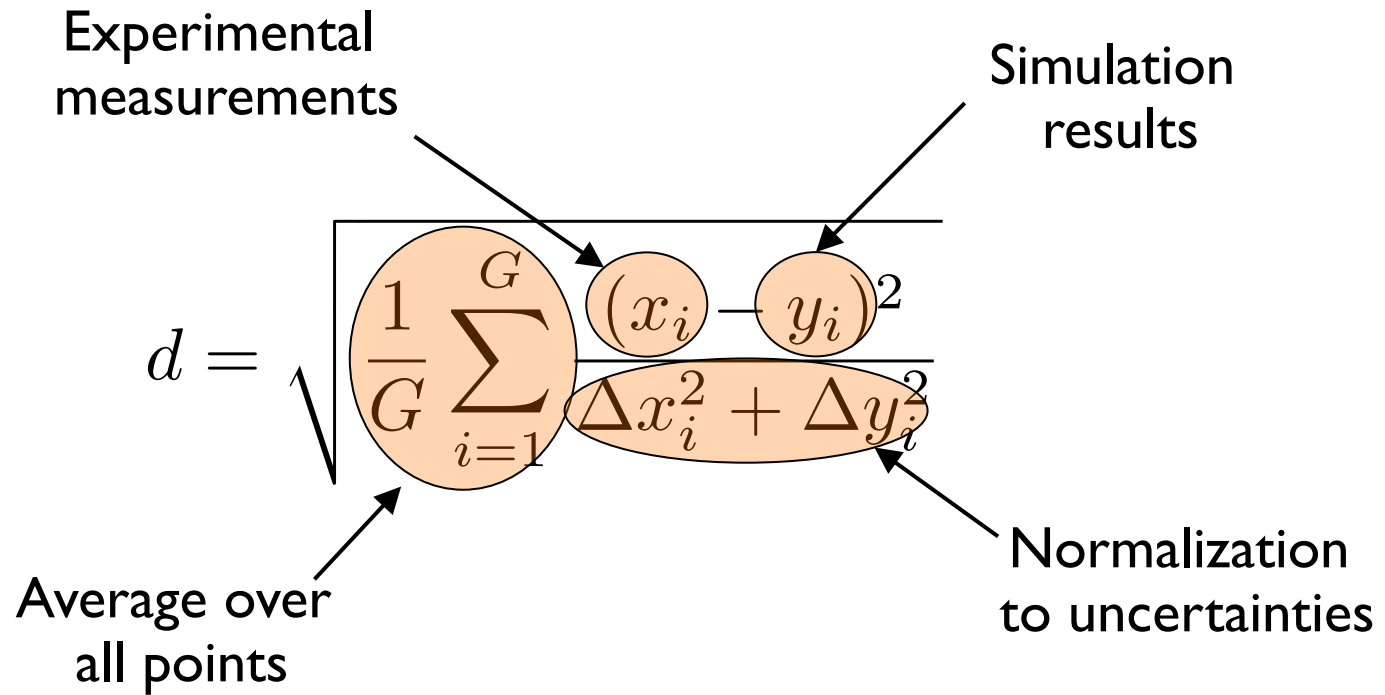

- Examples:  $\langle I_{\text{sat}} \rangle_t$ ,  $\langle n \rangle_t$ ,  $\Gamma$ , ... **to be compared**
- A validation observable should not be a function of the others
- 11 observables for our validation:

$$\langle n(r) \rangle_t, \langle T_e(r) \rangle_t, \langle I_{\text{sat}}(r) \rangle_t, \delta I_{\text{sat}} / I_{\text{sat}}, k_v, \text{PDF}(I_{\text{sat}}), \dots$$

# Agreement with respect to an individual observable

Distance:

Level of agreement:

$$R = \frac{\tanh[(d - d_0)/\lambda] + 1}{2}$$

$$d_0 = 1.5$$

$$\lambda = 0.5$$

# Observable hierarchy

---

Not all the observables are equally worthy...

The hierarchy assesses the assumptions used for their deduction

$h^{\text{exp}}$  : # of assumptions to get  
the observable from  
experimental data

$h^{\text{sim}}$  : same for simulation  
results

$$h = h^{\text{exp}} + h^{\text{sim}}$$

**Examples:**

- $\langle n \rangle_t$  :  $h^{\text{exp}} = 1$ ,  $h^{\text{sim}} = 0$ ,  $h = 1$
- $\Gamma_{I_{\text{sat}}}$  :  $h^{\text{exp}} = 2$ ,  $h^{\text{sim}} = 1$ ,  $h = 3$

# Composite metric

Normalization:

- $\chi = 0$ : perfect agreement
- $\chi = 0.5$ : agreement within uncertainty
- $\chi = 1$ : total disagreement

# The validation results

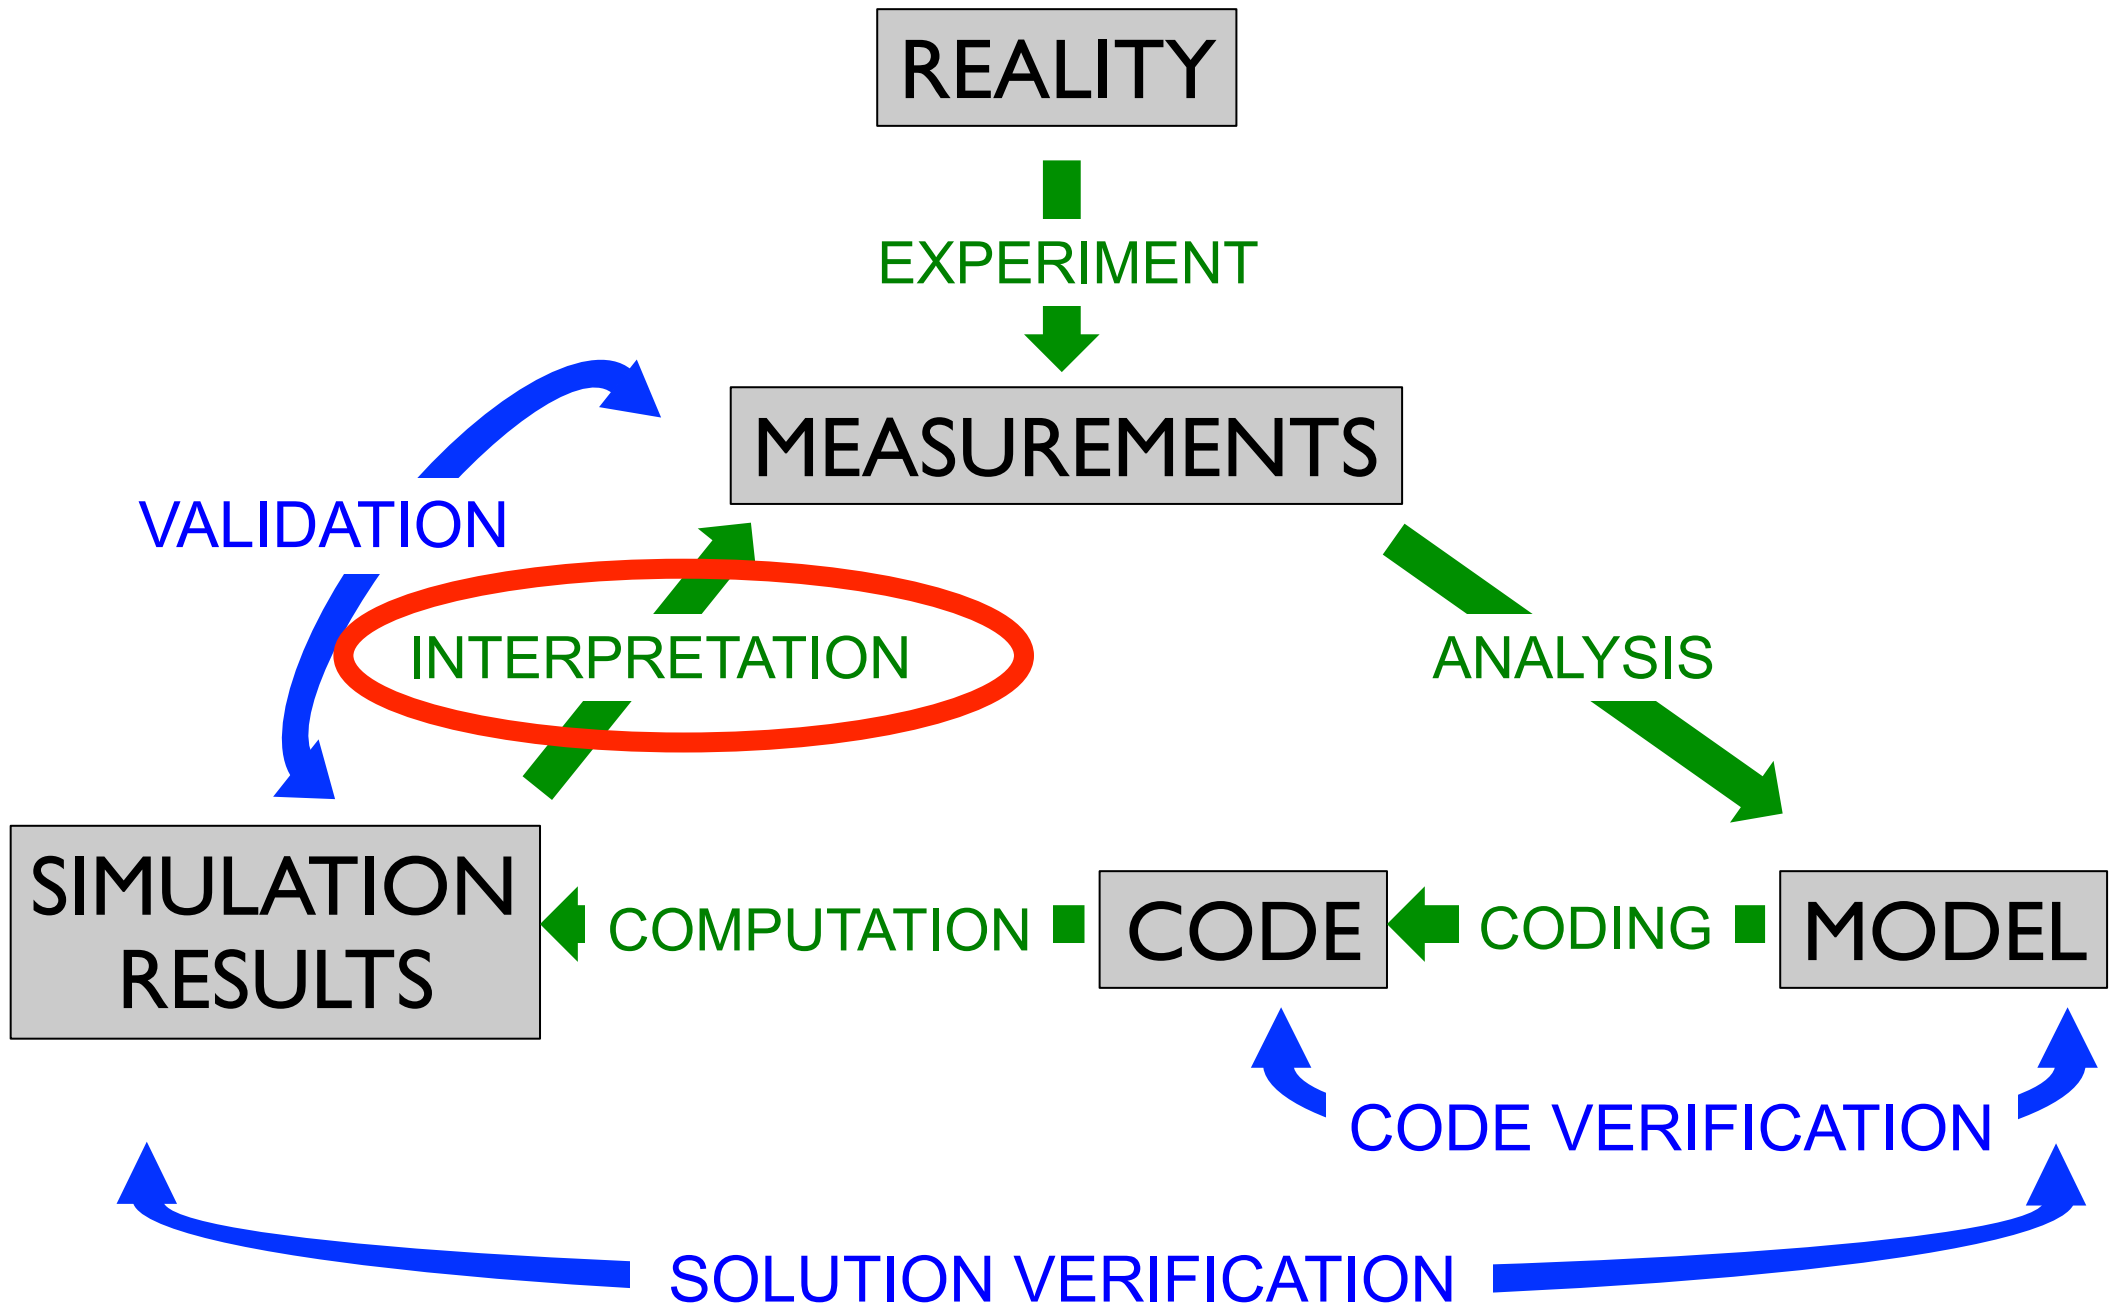

Ricci et al., PoP 2009, PoP 2011

Why 2D and 3D work equally well at low  $N$  and 2D fails at high  $N$ ?  
What can we learn on the TORPEX physics?

# Verification & Validation

---

# Flute instabilities - ideal interchange mode

---

$$k_{\parallel} = 0 \quad \longrightarrow$$

$$n + T_e \text{ eqs.} \quad \longrightarrow \quad \frac{\partial p_e}{\partial t} = \frac{c}{B} [\phi, p_e]$$

$$\text{Vorticity eq.} \quad \longrightarrow \quad \frac{\partial \nabla_{\perp}^2 \phi}{\partial t} = \frac{2B}{cm_i R n} \frac{\partial p_e}{\partial y}$$

$$\longrightarrow \quad \gamma = \gamma_I \quad \gamma_I = c_s \sqrt{\frac{2}{L_p R}}$$

Compressibility stabilizes the mode at  $k_{\perp} \rho_s > 0.3 \gamma_I R / c_s$

# Anatomy of a $k_{\parallel} = 0$ perturbation

---

$\lambda_v$  : longest possible vertical wavelength of a perturbation

$$\text{If } k_{\parallel} = 0 \text{ then } \lambda_v = \Delta = \frac{L_v}{N}$$

# TORPEX shows $k_{\parallel} = 0$ turbulence at low $N$

---

$$k_{\parallel} = 0 \quad (\lambda_v = L_v/N)$$

Ideal interchange regime

For  $N \sim 1-6$ , ideal  $k_{\parallel} = 0$  interchange modes dominant

---

$N=2$

# Turbulence changes character at $N > 7$

# At high $N > 7$ , Resistive Interchange Mode turbulence

Toroidally symmetric

$$\lambda_v \sim L_v$$

$k_{\parallel}$  stabilization, requires high  $N$  and  $\eta_{\parallel} \neq 0$

Introducing  $k_{\parallel} \neq 0$   
modes

$$\gamma^2 = \gamma_I^2 - \gamma \frac{4\pi V_A^2 k_{\parallel}^2}{\eta_{\parallel} c^2 k_y^2}, \quad \gamma_I = c_s \sqrt{\frac{2}{RL_p}}$$

# Interpretation of the validation results

$$k_{\parallel} = 0$$

- Ideal interchange turbulence
- 2D model appropriate

$$k_{\parallel} \neq 0$$

- Compressibility stabilizes ideal interchange
- Resistive interchange turbulence
- 2D model not appropriate

# Where can a Verification & Validation exercise help?

---

1. Make sure that the code works correctly, and assess the numerical error

The correct implementation of GBS rigorously shown, the discretization error estimate for the quantity of interest estimated

2. Compare codes

2D and 3D simulations agree with experimental measurements similarly at low  $N$ .

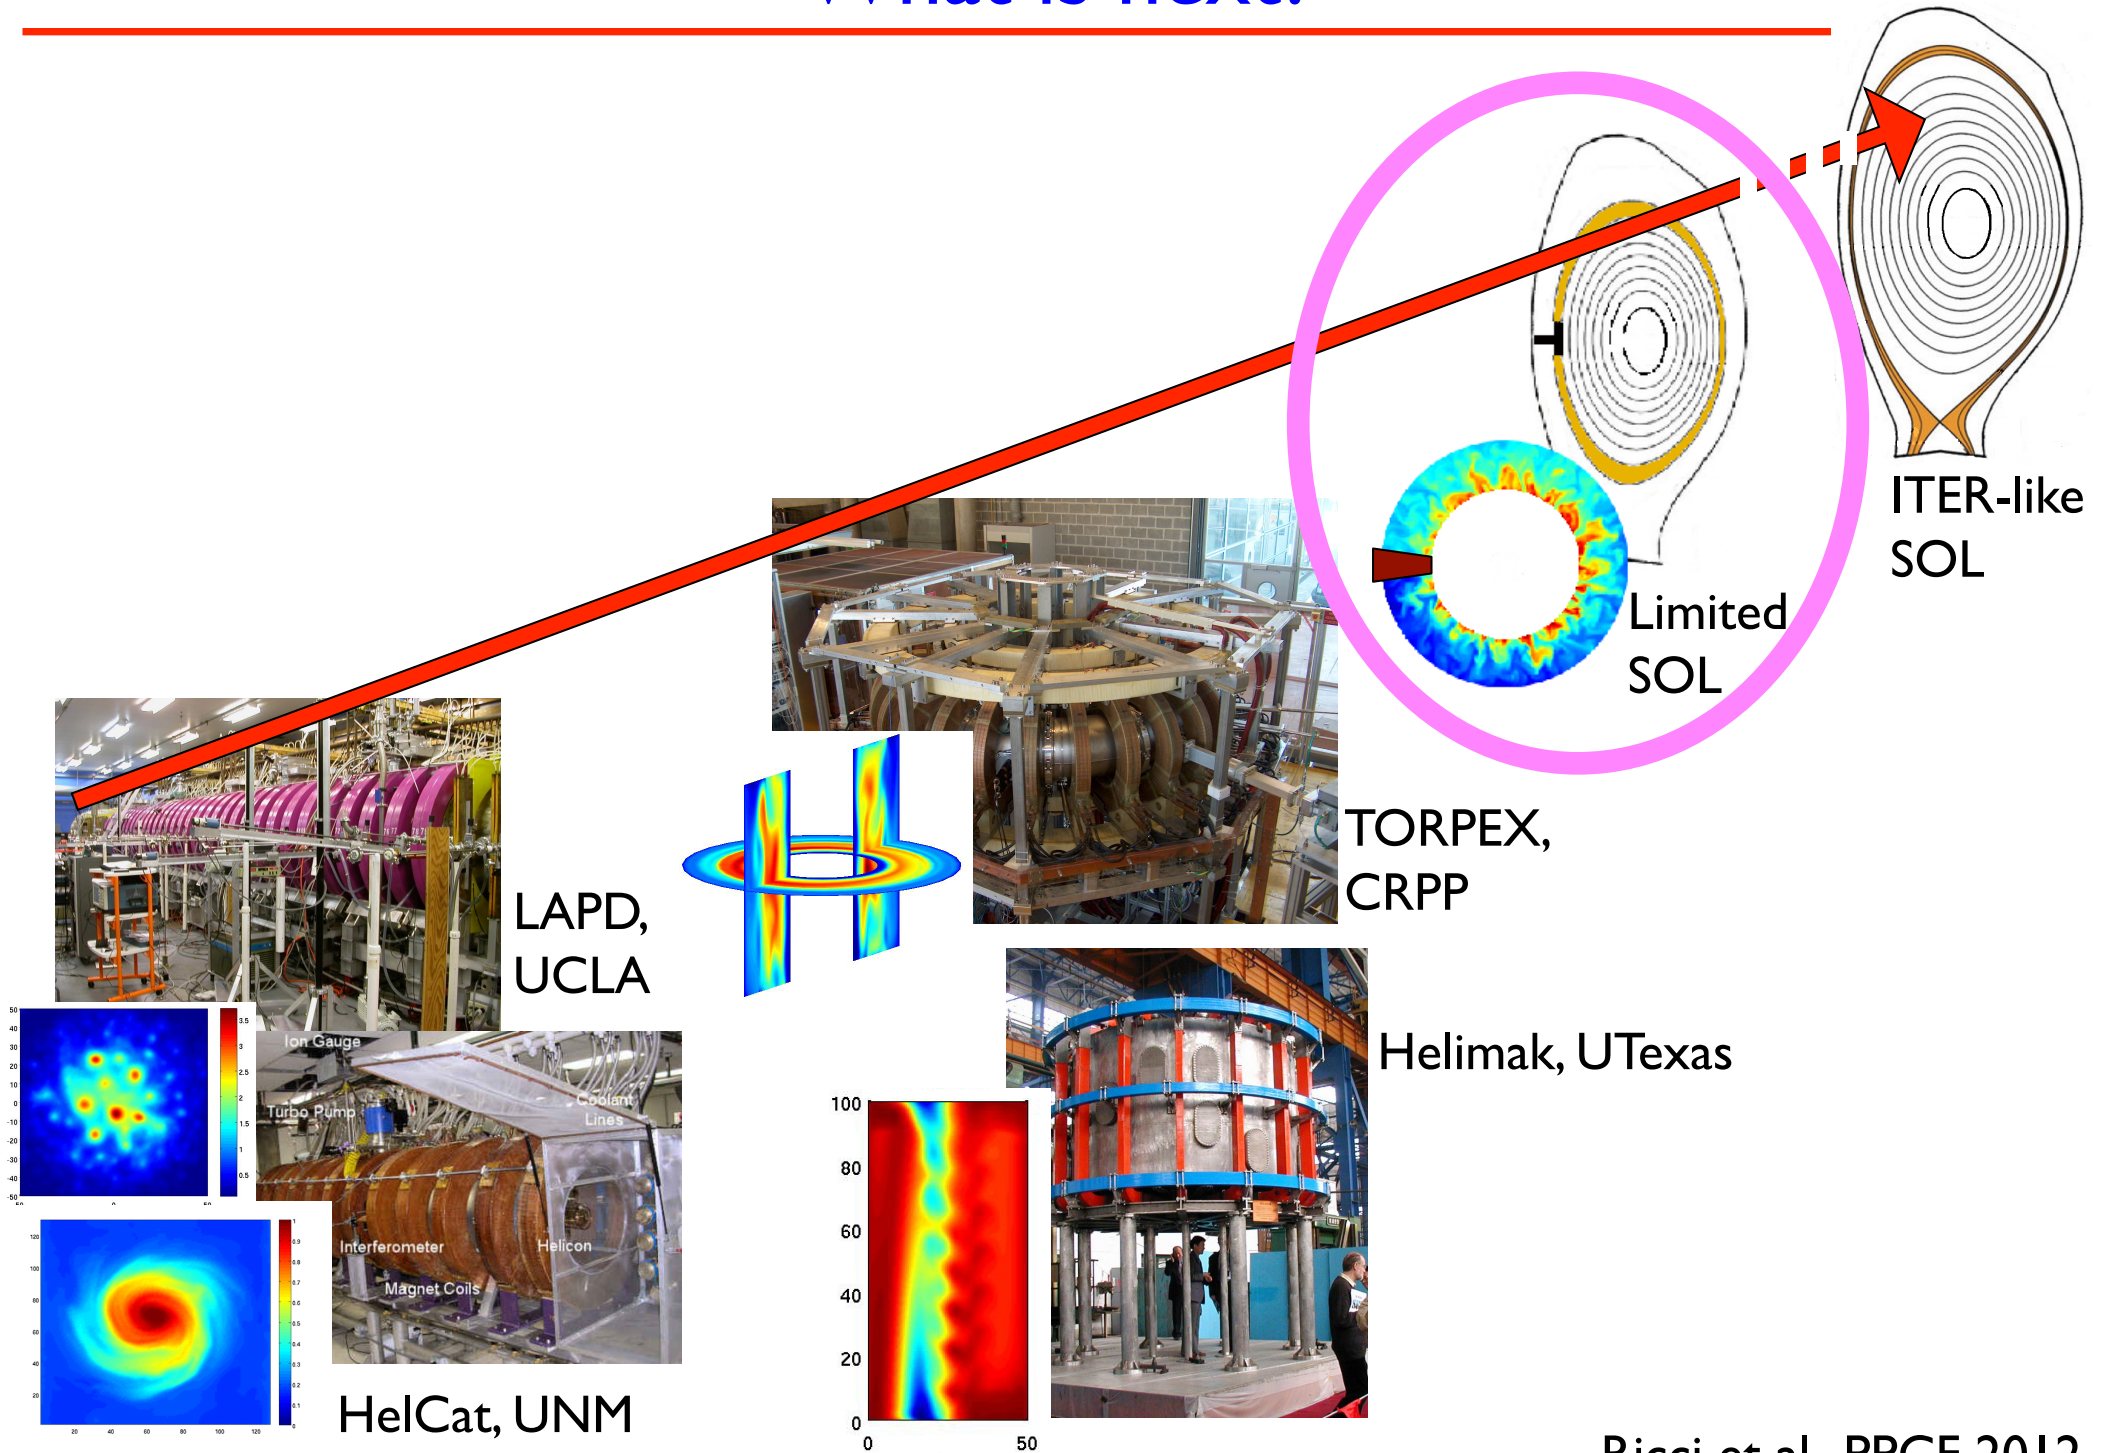

Global 3D simulations are needed to describe the plasma dynamics at high  $N$ .

3. Let the physics emerge

Two turbulent regimes: ideal interchange mode at low  $N$  and non-flute modes at high  $N$ .

Parameter scans have a crucial role

# What is next?

# Where can a Verification & Validation exercise help?

---

1. Make sure that the code works correctly, and assess the numerical error

The correct implementation of GBS rigorously shown, the discretization error estimate for the quantity of interest estimated

2. Compare codes

2D and 3D simulations agree with experimental measurements similarly at low  $N$ .

Global 3D simulations are needed to describe the plasma dynamics at high  $N$ .

3. Let the physics emerge

Two turbulent regimes: ideal interchange mode at low  $N$  and non-flute modes at high  $N$ .

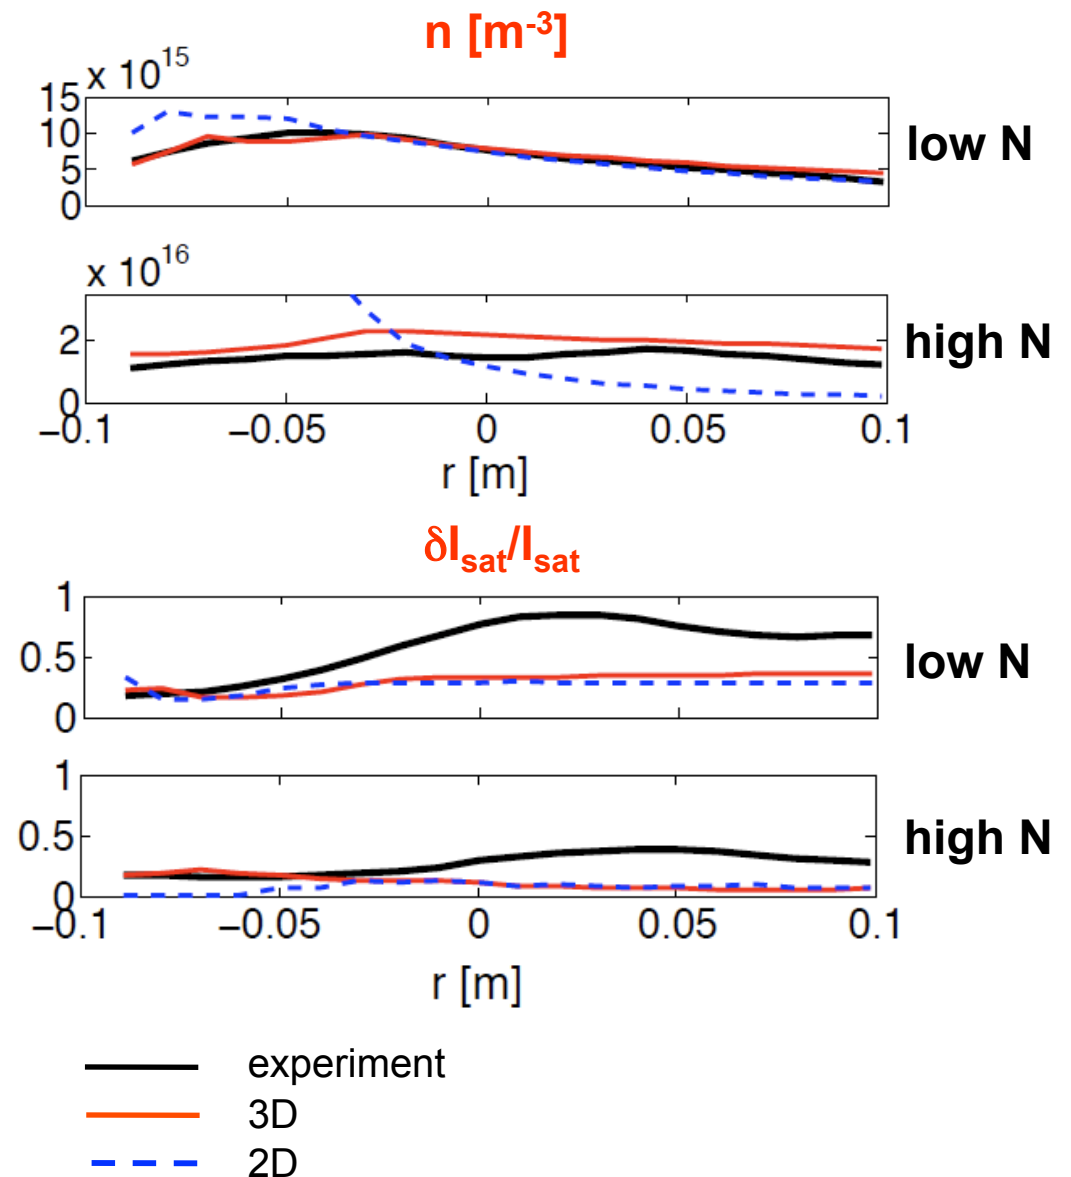

Parameter scans have a crucial role

# Evaluation of the validation observables

We evaluate 11 observables:

- $\langle n(r) \rangle_t$
- $\langle T_e(r) \rangle_t$
- $\langle I_{\text{sat}}(r) \rangle_t$
- $\delta I_{\text{sat}} / I_{\text{sat}}$
- $k_\nu$
- PDF( $I_{\text{sat}}$ )
- ...

## Examples

# Why does TORPEX transition from ideal to resistive interchange for large $N$ ?

---

$N$  ↑

Resistive interchange requires high  $N$

Ideal interchange requires low  $N$ :

$$\lambda_v = \frac{L_v}{N} \quad \text{thus} \quad k_v = \frac{2\pi N}{L_v}$$

stable:  $k_v \rho_s > 0.3 R \gamma_I / c_s$

Threshold:  $N \sim 10$  in TORPEX

# What comes next?

- Validation at each code refinement
- Considering more observables
- Involving more codes

ITER-like SOL

Limited SOL

TORPEX CRPP

LAPD, UCLA

HelCat, UNM

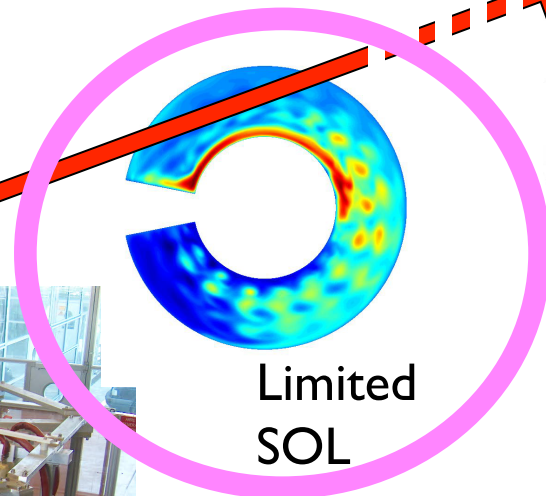

Helimak, UTexas

# What comes next?

Validation on a recently achieved SOL-like configuration in TORPEX

ITER-like SOL

Helimak, UTexas

# Where can a verification & validation exercise help?

---

## 1. Make sure that the code works correctly

Rigorously, with discretization error estimate

## 2. Compare codes

2D and 3D simulations agree with experimental measurements similarly at low  $N$ .

Global 3D simulations are needed to describe the plasma dynamics at high  $N$ .

## 3. Let the physics emerge

Two turbulent regimes: ideal interchange mode at low  $N$  and non-flute modes at high  $N$ .

Parameter scans have a crucial role

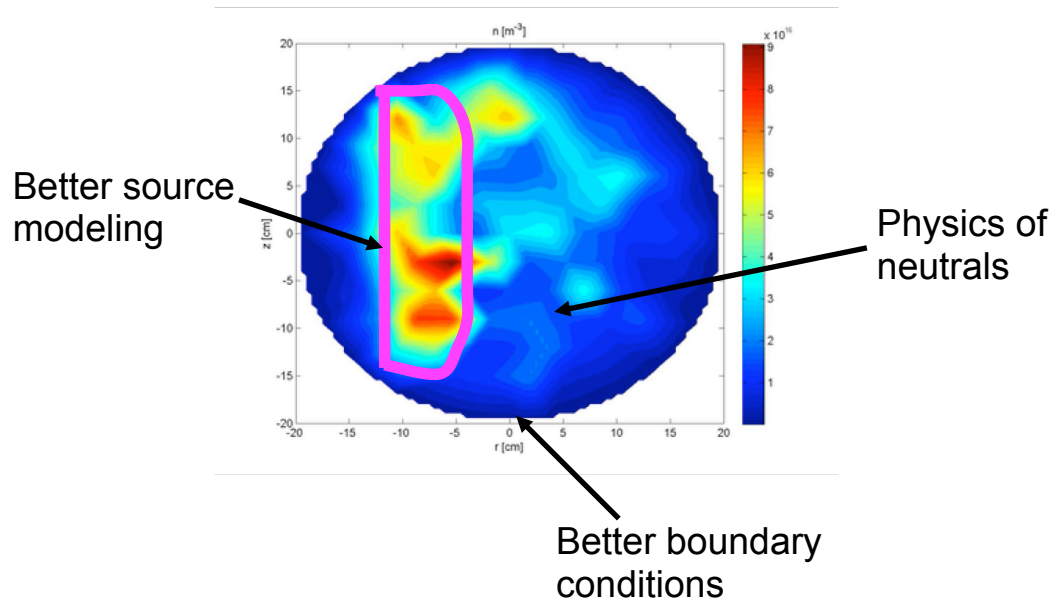

## 4. Assess the predictive capabilities of a code

3D simulations predict (within uncertainty) profiles of  $n$  but not of  $I_{\text{sat}}$

# Future work

**Missing ingredients for a complete description of plasma dynamics in TORPEX:**

**Use of more diagnostics: Mach probes, Triple probes or Bdot probes to compare other interesting observables.**

# V&V

A validation project requires a four step procedure:

- (i) Model qualification
- (ii) Code verification
- (iii) Definition and classification of observables
- (iv) Quantification of agreement

$$\begin{aligned} \frac{\partial n}{\partial t} = & R[\phi, n] + 2 \left( n \frac{\partial T_e}{\partial y} + T_e \frac{\partial n}{\partial y} - n \frac{\partial \phi}{\partial y} \right) + D_n \nabla_{\perp}^2 n \\ & - n \frac{\partial V_{\parallel e}}{\partial z} - V_{\parallel e} \frac{\partial n}{\partial z} + S_n, \end{aligned} \quad (1)$$

$$\begin{aligned} \frac{\partial \nabla_{\perp}^2 \phi}{\partial t} = & R[\phi, \nabla_{\perp}^2 \phi] - V_{\parallel i} \frac{\partial \nabla_{\perp}^2 \phi}{\partial z} + 2 \left( \frac{T_e}{n} \frac{\partial n}{\partial y} + \frac{\partial T_e}{\partial y} \right) \\ & + \frac{1}{n} \frac{\partial j_{\parallel}}{\partial z} - \frac{\eta_{0i}}{n} \left( 2 \frac{\partial^2 V_{\parallel i}}{\partial y \partial z} + \frac{\partial^2 \phi}{\partial y^2} \right) + D_{\phi} \nabla_{\perp}^4 \phi, \end{aligned} \quad (2)$$

$$\begin{aligned} \frac{\partial T_e}{\partial t} = & R[\phi, T_e] - V_{\parallel e} \frac{\partial T_e}{\partial z} + \frac{4}{3} \left( \frac{7}{2} T_e \frac{\partial T_e}{\partial y} + \frac{T_e^2}{n} \frac{\partial n}{\partial y} - T_e \frac{\partial \phi}{\partial y} \right) \\ & + D_T \nabla_{\perp}^2 T_e + \frac{2}{3} \frac{T_e}{n} 0.71 \frac{\partial j_{\parallel}}{\partial z} - \frac{2}{3} T_e \frac{\partial V_{\parallel e}}{\partial z} + S_T, \end{aligned} \quad (3)$$

$$\begin{aligned} \frac{m_e}{m_i} n \frac{\partial V_{\parallel e}}{\partial t} = & \frac{m_e}{m_i} n R[\phi, V_{\parallel e}] - \frac{m_e}{m_i} n V_{\parallel e} \frac{\partial V_{\parallel e}}{\partial z} - T_e \frac{\partial n}{\partial z} + n \frac{\partial \phi}{\partial z} \\ & - 1.71 n \frac{\partial T_e}{\partial z} + n v j_{\parallel} + \frac{4}{3} \eta_{0e} \frac{\partial^2 V_{\parallel e}}{\partial z^2} + \frac{2}{3} \eta_{0e} \frac{\partial^2 \phi}{\partial y \partial z} \\ & - \frac{2}{3} \frac{\eta_{0e}}{n} \frac{\partial^2 p_e}{\partial z \partial y} + D_{V_e} \nabla_{\perp}^2 V_{\parallel e}, \end{aligned} \quad (4)$$

$$\begin{aligned} n \frac{\partial V_{\parallel i}}{\partial t} = & n R[\phi, V_{\parallel i}] - n V_{\parallel i} \frac{\partial V_{\parallel i}}{\partial z} - T_e \frac{\partial n}{\partial z} - n \frac{\partial T_e}{\partial z} \\ & + \frac{4}{3} \eta_{0,i} \frac{\partial^2 V_{\parallel i}}{\partial z^2} + \frac{2}{3} \eta_{0,i} \frac{\partial^2 \phi}{\partial y \partial z} + D_{V_i} \nabla_{\perp}^2 V_{\parallel i}, \end{aligned} \quad (5)$$
