Impaired Speech Recognition

A thesis presented in partial fulfilment of the
requirements for the degree of

Master of Information Sciences
in
Computer Science

Massey University, Albany, New Zealand.

Mohammed Nasser Almujil

2015

Abstract

The purpose of this thesis is to present a novel mobile health application that can recognize impaired speech (using audio signals) and turn it into understandable speech. The system is developed to help Dysarthria of Speech patients communicate better with others in their everyday life. It will provide some background information about motor speech disorders, Dysarthria of Speech and the technical aspects of this application. It will then explain and test the algorithms to recognize impaired speech using audio fingerprinting technology. Finally it will discuss the test results and recommends some future work to improve the current algorithms.

Acknowledgements

I would like thank my project supervisor, Associate Professor Ruili Wang, for his advice and support throughout the course of this project, and for giving me the opportunity to write about this interesting topic.

Contents

Abstract	2
Acknowledgements	3
1 Introduction	7
1.1 Moto speech disorders	7
1.2 Dysarthria	8
1.3 Current situation	9
1.4 Objectives	9
1.5 Speech Assistant Introduction	10
2 Literature review:	12
2.1 Audio Fingerprinting	12
2.2 Audio Fingerprinting alternatives	14
2.2.1 Audio signal	15
2.2.2 Database	15
2.2.3 Robustness	16
2.3 Audio fingerprinting system properties	17
2.4 Audio fingerprint extraction and matching algorithms	18
