THE APPROACH TO MEASURING THE RETURNS TO SECONDARY AND TERTIARY QUALIFICATIONS IN NEW ZEALAND: AN INVESTIGATION AND UPDATE USING DATA FROM THE 2001 CENSUS

A Research Thesis submitted in fulfilment of the requirements for the degree of Master of Applied Economics at Massey University

NATHAN J. PENNY

DEPARTMENT OF APPLIED AND INTERNATIONAL ECONOMICS

COLLEGE OF BUSINESS
MASSEY UNIVERSITY, NEW ZEALAND

Acknowledgements

I would like to take this opportunity to thank the many Massey University staff who have helped not only with this research, but throughout my studies at the Department of Applied and International Economics. In particular, Stuart Birks, Ha Lien Ton, Dr Jen-Je Su and Dr Vilaphonh Xayavong have made invaluable contributions towards this thesis.

I would like to thank Roger Smyth from the Ministry of Education for his encouragement and assistance in making this study possible. Also, I would like to extend my thanks to John Upfold and the team at Stats New Zealand for their assistance in the datalab.

In addition, I would like to show my appreciation to my family and thank them for their patience, understanding and support.

The final word of thanks goes to all my fellow students at Massey University who have made my time there thoroughly enjoyable.

Abstract

This study investigates the approaches to measuring the returns to secondary and tertiary qualifications in New Zealand using the latest Census of Population and Dwellings data from 2001. It calculates the returns to qualifications using income function analysis, elaborate analysis and also extends the elaborate analysis by using the quantile regression technique. It reports returns within a narrow band for both methods and at a similar or higher magnitude to previous years. However, the results reported using the net present value (NPV) criteria reveal higher social returns to qualifications than private returns. This contradicts previous literature. In the policy implications section, the study recommends policies focus more on reducing the level of forgone earnings. Also, the study finds that income function analysis is better suited to measuring income inequality and its link with education. Furthermore, the study concludes that elaborate analysis, using the NPV criteria, allows better comparison of the marginal returns to educational investments of varying scale and duration. Finally, the quantile regression estimates show that point estimates of the mean return give a poor indication of the distribution of returns.
