**Characterization of *Arabidopsis thaliana* CPR5
via the Elucidation of Interacting Protein
Partners**

A thesis presented in partial fulfilment of the requirements
for the degree of

Masters of Science in Biochemistry

At Massey University, Palmerston North, New Zealand

Fiona (Shane) Chiem 2015

Abstract

The *Arabidopsis thaliana* Constitutive expresser of pathogenesis related genes5 (*CPR5*) has previously been suggested to play a role in the regulation of disease resistance, plant and cell proliferation, development and death. Analysis of *cpr5* mutant alterations to hormone and hormone-like signalling mechanisms have provided evidence that abolishment of *CPR5* involvement within these hormone signalling pathways, results in many of the stunted growth, early senescence and constitutive expression of pathogen defense phenotypes observed. Despite the pleiotropic effect that *cpr5* mutants have on the plant system, it is unclear whether *CPR5*-dependent pathways are due to a direct interaction with *CPR5* or due to a more indirect association. *CPR5* has been proposed to be a regulator of a multitude of different pathways, including reactive oxygen species (ROS), cell wall biosynthesis, and transcription but evidence of these proposals are limited to the effects that *cpr5* mutants have on downstream targets.

In an attempt to address the involvement of *CPR5* in *Arabidopsis* plant processes, a series of studies were conducted to determine the protein interacting partners of *CPR5*. Proteins were identified via 2 independent yeast 2 hybrid (Y2H) screening of an *Arabidopsis* transcriptome library. Ten proteins of interest were identified via two independent screenings using two truncated forms of *CPR5*. Functional involvement of *CPR5* with the identified proteins was further explored using the Y2H pairwise interaction system. *CPR5* was found to interact with 3 full length proteins identified.

To explore the possibility that *CPR5* interacts with multiple protein partners in different locations within the cell, Bifluorescence molecular complementation assays were performed to determine the localization and interaction of *CPR5* with the ten identified genes as well as 3 previously identified genes. Several novel interactions were identified that occur within the nucleus and outside of the nucleus. Not only was *CPR5* confirmed to have an interaction with *KRP2* within the nucleus, *CPR5* exhibited interaction with *FSD1*, *CRK4*, *PATL3*, *PATL5*, and *PATL6*, outside of the nucleus.

In the final set of experiments, several double mutant lines were produced that did not yield any observable phenotypes that differ from *cpr5-2* single mutant plants. In order to determine the effects these double mutants have on various plant processes affected by *cpr5-2* single mutant; qRT-PCR was performed to determine the expression pattern of pathogen related genes (*PR1* and *PDF1.2*) known to be significantly upregulated in *cpr5-2* plants. qRT-PCR analysis revealed that *cpr5-2 fsd1* exhibits a down-regulation of *PDF1.2*.

PR1 regulation was found to be down-regulation in *cpr5-2 bzip61* and up-regulated in *cpr5-2 pat13* compared to *cpr5-2*.

Sugar and dark treatment of the *cpr5-2* double mutant lines yielded several alterations to hypocotyl length, root length, and apical hook curvature by several of the double mutant lines, indicating a connection between CPR5 and the knocked out gene of interest. None of the double mutants were able to completely rescue the sugar-induced morphological phenotypes exhibited by *cpr5-2*, and some double mutant lines exhibited more pronounced effects indicating an additive effect by sugar treatment.

Together this data suggests that CPR5 interacts with various proteins involved in different plant processes in various locations throughout the cell. Further research of these proteins and a more direct analysis of the interaction that may occur between CPR5 and these proteins will be required to provide a foundation for more direct characterization the *CPR5* molecular function; and ultimately to determine the role that CPR5 plays within the hormone and hormone like signalling pathway and their effects on major plant processes.

Acknowledgements

I would like to thank my supervisor Dr. Paul Dijkwel for giving me this opportunity and for helping me complete my Masters degree. Paul has been an exemplary supervisor providing me with the guidance I required when help was asked and for challenging me. I thank you for the patience you have shown me and for providing me with the independence I required to succeed. Thank you especially for your confidence in my abilities to successfully accomplish the goals we set forth and for allowing me to carry out these goals in my own unorthodox fashion.

I would like to thank Elizabeth Jennens for always believing in me and for giving me the love, space, and time to complete my degree. Without you I would not have started my Masters and I would not be where I am in my life without you.

I would like to thank Prof. Michael McManus and all of my C5.19 lab mates for their critiques and insights and for listening when I needed help with my research. In particular, I would like to thank my family away from home, Jay Jayaraman and Srishti Joshi, for their continual help academically and personally. I cannot imagine my time at Massey without your unwavering friendships, and willingness and dedication to helping me in all aspects of my life.

To my parents, family, and friends, I am forever grateful for your unending encouragement as I continued my studies around the world, and for your understanding as I concentrated on finishing my thesis. Knowing that you are all waiting for me to come home gave me the motivation I needed to return to you having successfully completed another chapter of my life.

I would most especially like to thank my mother, Sandy Chiem, for allowing me to be my independent self despite how much it hurt to let me travel in distance and on my own path of life. You have shown me such unrelenting selfless love and support regardless the decisions I make, and it is for you and because of you that I am inspired to be the best version of myself.

Abbreviations

'	minutes
"	seconds
Ade	Adenine
aa	amino acids
amp	Ampicillin
BiFC	BiFluorescence Molecular Complementation
BLAST	Basic logical alignment search tool
bp	Base-pair
cDNA	DNA synthesized from an mRNA template
C-terminus (terminal)	(at the) carboxy-terminal end of a polypeptide chain
<i>CPR5</i>	<i>CPR5</i> wild-type gene
CPR5	CPR5 wild-type protein
<i>cpr5</i>	<i>CPR5</i> mutant gene
cpr5	CPR5 mutant protein
cpr5-2	<i>cpr5</i> mutant line with mutation at aa420 (W->stop)
DAPI	A DNA binding fluorescent stain ((4',6-diamidino-2-phenylindole)
DNA	Deoxyribonucleic acid
DNase	Deoxyribonuclease
dNTP	2'-deoxynucleotide 5' triphosphate
dH2O	distilled water
ddH2O	double distilled water
<i>E. coli</i>	<i>Escherichia coli</i>
EDTA	Ethylenediaminetetraacetic acid
FW	Fresh weight
g	Gram
gDNA	Genomic DNA
Gen	Gentamycin
h	Hour
His	Histidine
IPTG	Isopropyl- β -D-thiogalactopyranoside
kan	kanamycin
kb	Kilo base-pair
kD(a)	Kilo daltons
L	Litre
LB	Luria-Bertani (media or broth)
Leu	Leucine
M	Molarity (moles per litre)
MCS	Multiple cloning site
mg	Miligram
Milli-Q-water	Water purified by Milli-Q-ion exchange chromatography

ml	Milliliters
mol	Mole (Avagadro's number)
mRNA	Messenger RNA
MS	Murashige & Skoog Media
NCBI	National Centre for Biotechnology Information
ng	Nanogram
OD600	optical density at 600nm (measured in a spectrophotometer)
°C	Degree celsius
PAGE	Polyacrylamide gel electrophoresis
PBS	Phosphate buffer saline
PCR	Polymerase chain reaction
pH	-Log (H ⁺)
psi	a unit of pressure (pounds per square inch)
qRT-PCR	Reverse transcriptase-polymerase chain reaction
RE	Restriction Enzyme
Rnase	Riboxynuclease
RO	Reverse osmosis
rpm	revolutions per minute
SALK	Arabidopsis T-DNA insertion lines from the SALK Institute, a non-profit research organization
SD	Synthetic Defined (media)
SDS	Sodium Dodecyl Sulfate
SEM	Standard error mean
TAE	Tris base, acetic acid, and EDTA buffer
TAIR	The Arabidopsis Information Resource
TE	Tris base, EDTA buffer
Tet	Tetracycline
T _m	Melting temperature at which DNA strands separate prior to annealing
Tris	Tris (hydroxymethyl) aminomethane
Trp	Trpytophan
Tween-20	Polyoxyethylenesorbitan monolaurate
U	Unit (based on enzyme activity)
µg	Microgram
µl	Microlitre
µM	Micromolar
V	Volt
v/v	Volume per volume
w/v	Weight per volume
w/w	Weight per weight
X-α-Gal	X-α-Gal is a chromogenic substrate used to detect α-galactosidase activity
Y2H	Yeast-2-hybrid
YFP	Yellow fluorescent protein
YPDA	yeast peptone dextrose adenine (media/agar)
