**SOCIAL PHYSIQUE ANXIETY, PREGNANCY
AND EXERCISE**

A thesis presented in partial fulfilment of the
requirements for the degree of

Master of Arts

in

Psychology

at Massey University, Albany,

New Zealand.

Janet Mary Blind

2004

ABSTRACT

The purpose of this study was to examine SPA and exercise during and after pregnancy. Women enrolled in community ante-natal classes participated in the investigation (Exercisers n = 36; Non-exercisers n = 17). Participants completed the Social Physique Anxiety Scale (SPAS), Reasons for Exercise Inventory (REI), Exercise Behaviours and Preferences Scale and a modified Body Esteem Scale, and provided general demographic and exercise data during pregnancy and 6 weeks and 3 months post-pregnancy. Repeated measures ANOVA indicated that participant reasons for exercise changed significantly over the course of pregnancy from intrinsic to extrinsic, reflecting self-presentational motives. SPA has been found to be positively related to self-presentational motives in previous research, although significant results were not replicated in this study.

ACKNOWLEDGEMENTS

With thanks to my supervisor, Richard Fletcher, for your time and expertise and willingness to share both over the years. Thank you also to my husband and family for their support, encouragement and patience throughout this experience. Also to Amy and Peter, my children: without you the idea would never have developed further.
