2002

ABSTRACT

There has been an increase in recent years in the number of Geographic Information System (GIS) applications being developed for stakeholders using Commercial Off-The-Shelf (COTS) software. There are a lack of guidelines in both industry and the literature on how to acquire user requirements for the development of GIS applications in this COTS software environment.

This study investigates process activities in order to build a framework to address these inadequacies. The construction of the framework incorporates requirements engineering and COTS software evaluation and selection process activities from the Information Systems (IS) area. The framework is used to explore three issues related to developing GIS applications and used to determine whether: 1) a life cycle model is used to guide the gathering and analysing of requirements when developing GIS applications, 2) standard IS requirements processes can be used for developing GIS solutions, and 3) standard IS COTS software acquisition processes can be used for developing GIS solutions. Case studies were used to analyse current practices in the GIS industry and to validate the usefulness of these activities in the framework.

The results of this investigation suggest that RE practices associated with the COTS paradigm within the IS arena are suitable for developing GIS applications based on user requirements.

ACKNOWLEDGEMENTS

A special thanks to the four participants from the two organisations used for the multiple-case study. I know time is scarce and is an expensive commodity, so I truly appreciate the effort you all gave in contributing towards this research.

Thank you to my supervisor, Mrs Elisabeth Todd for her patience and the several cups of coffee to make light work of research meetings. I would also like to thank Mr Arthur Todd and Mr Larry Haist for helping me 'fill in the gaps', and to keep my research rigorous. Their advice has been invaluable.

I would like to thank ESRI for giving me the opportunity to work in their professional services section as an intern and gaining wonderful friendships through this experience. I would also like to express my gratitude to Massey University for the financial support of getting me to the USA to carry out the internship.

Most of all I wish to thank my parents who have always been incredibly supportive of my postgraduate studies, particularly my mother for having the patience of proof reading this thesis for me. Also, to my husband, who has been extremely positive and encouraging, and has always been there through my moments of confusion.
