Abstract

Several literacy reports published in the last decade have emphasised the large gap in the reading attainment of children in New Zealand. A common barrier that prevents poor readers to catch up to their peers is difficulty in reading fluency, which is theorised to represent underlying difficulty in rapid and automatic word recognition. The ability to rapidly recognise a few common words, also known as *high frequency words* (HFWs), may increase the fluency of reading the majority of novel text. As such, the National Standards for literacy achievement outline the development of basic HFW vocabulary by the end of the first few years at school. However, past research that has investigated single word training has rarely used HFWs and those that have used HFWs have scarcely investigated its transfer to in-text reading. Therefore, the aims of the current research were to provide an investigation of HFW training and its influence on word reading accuracy, in-text word reading, and passage reading accuracy, speed, and comprehension. Experiment 1 was a single case design carried out with one 8 year old participant and was largely used to inform the second experiment. Experiment 2 was a multiple baseline design carried out with five 8-9 year old participants using a modified training procedure. Experiment 1 utilised visual analysis and Cohen's *d* effect size analysis whereas Experiment 2 also used statistical analysis, made possible through the Wampold-Worsham method of randomisation incorporated into the experimental design. The results of both experiments indicated that training facilitated word reading accuracy but the successful transfer of target words to in-text reading was only observed in Experiment 2. Post-training increases to passage reading accuracy, speed, and comprehension scores were not apparent in either experiment. The main contribution of the current research is its applicability to classroom practice. Another important contribution of the study to research practice is the rare application of the Wampold-Worsham method of randomisation

Acknowledgements

I would like to sincerely thank everyone that has supported me in completing this research project. Thank you to the wonderful children that took part in the study, watching you all grow in confidence and enjoy the training with me confirmed to me that all the hard work I was putting in was meaningful and worthwhile. Thank you also to the amazing teachers at the wonderful west Auckland school for welcoming me into your school community.

I would like to thank my supervisor Tom for your constant support and guidance. I really appreciate the effort you put in to listen to all my complicated (and sometimes convoluted) ideas. It made a huge difference to my confidence in communicating my ideas. I would also like to thank my second supervisors Jane for contributing her amazing talent for critical thinking and attention to detail, and Alison for contributing her valuable subject expertise at the end stages of the project.

My family has been my rock throughout this journey and I would like to express my immense gratitude for the unyielding support, love, and enthusiasm of my amazing mama, siblings, and husband study buddy.

Finally, I would like to thank the Almighty for giving me the opportunity to know and meet such amazing people. I will (God willing) continue to seek my path to success as one that is defined by my intention to please God.
