ALKUSANAT

Suomen ympäristökeskus (SYKE) on toiminut ympäristöalan kansallisena vertailulaboratoriona vuodesta 2001 lähtien. Toiminta perustuu ympäristöministeriön määräykseen, mikä on annettu ympäristönsuojelulain (86/2000) nojalla. Vertailulaboratorion tarjoamista palveluista yksi tärkeimmistä on pätevyyskokeiden ja muiden vertailumittausten järjestäminen. Vertailumittausten järjestäminen täyttää kansainvälisen ohjeiden ISO/IEC Guide 43-1 ja ILAC-G13 asettamat vaatimukset. SYKE:n laboratoriot on FINAS-akkreditointipalvelun akkreditoima testauslaboratorio T003 ja vertailumittausten järjestäjä PT01 (www.finas.fi).

Tämä pätevyyskoe on toteutettu SYKE:n vertailulaboratorion pätevyysalueella ja se antaa tietoa osallistujien pätevyyden lisäksi tulosten vertailukelpoisuudesta myös yleisemmällä tasolla.

Pätevyyskokeen onnistumisen edellytys on järjestäjän ja osallistujien välinen luottamuksellinen yhteistyö.

Parhaat kiitokset yhteistyöstä kaikille osallistuille!

PREFACE

Finnish Environment Institute (SYKE) has served as the National Reference Laboratory in the environmental sector designated by the Ministry of the Environment under the section 24 of the Environment Protection Act (86/2000) since 2001. The duties of the reference laboratory service include providing proficiency tests and other interlaboratory comparisons for analytical laboratories and other producers of environmental information. The proficiency testing service is a part of the SYKE laboratory management system based on the standard EN ISO/IEC 17025. The SYKE proficiency testing service also conforms to the requirements of ISO/IEC GUIDE 43-1 and ILAC G-13. The SYKE laboratories have been accredited by the Finnish Accreditation service as the testing laboratory T003 and as the proficiency testing provider PT01 (www.finas.fi).

This proficiency test has been carried out under the scope of the SYKE reference laboratory and it provides information about performance of the participants as well as comparability of the results at more general level.

The success of the proficiency test requires confidential co-operation between the provider and participants.

Thank you for your co-operation!

Helsingissä 10. Tammikuuta 2011 / Helsinki 10 January 2011

Marja Luotola

Laboratorionjohtaja / Chief of laboratory

1 Introduction

The Finnish Environment Institute (SYKE) carried out the proficiency test (PT) for analysis of elements in waters and soil in April–August 2010. The measurements were: Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, Zn (waters, sediment) and N, P, S, TC (sediment). The sample types were: artificial and natural water, municipal and industrial waste water and sediment. A total of 54 laboratories participated in the PT. In the PT the results of Finnish laboratories providing environmental data for Finnish environmental authorities were evaluated. Additionally, other water and environmental laboratories were welcomed in the proficiency test.

The test was carried out in accordance with the international guidelines, ISO/IEC Guide 43-1 [1], ISO/IEC 17043 [2], ISO 13528 [3] and IUPAC Recommendations [4]. The SYKE laboratory has been accredited by the Finnish Accreditation Service as a proficiency testing provider (PT01, www.finas.fi). SYKE is the accredited proficiency test provider on the field of the present test.

2 Organizing the proficiency test

2.1 Responsibilities

Organizing laboratory:

Finnish Environment Institute (SYKE), Laboratories
Hakuninmaantie 6, 00430 Helsinki, Finland
Phone: +358 20 610 123, Fax: +358 9 448 320

Sub-contractors in this proficiency test were:

Centre for Economic Development, Transport and the Environment in South Ostrobothnia, Vaasa, Finland for Hg analysis in industrial waste water and in sediment (testing laboratory T184, accredited by the Finnish Accreditation Service, www.finas.fi)

Water Protection Association of the Kokemäenjoki River in Tampere, Finland for sieving and dividing of sediment samples (testing laboratory T064, accredited by the Finnish Accreditation Service, www.finas.fi)

The responsibilities in organizing the proficiency test were as follows:

Mirja Leivuori, coordinator
Kaija Korhonen, substitute of coordinator
Keijo Tervonen, technical assistant
Sari Lanteri, technical assistant
Ritva Väisänen, technical assistant
Markku Ilmakunnas, technical assistant and lay-out of the report

The analytical experts were:

Olli Järvinen	heavy metal analyses (AAS, ICP-MS)
Timo Sara-Aho	heavy metal analyses (ICP-OES, ID-ICP-MS)
Teemu Näykki	Hg-analyses, ID-ICP-MS

2.2 Participants

54 laboratories from Finland, Sweden, Denmark, Germany, Uruguay and Russia participated in the PT (Appendix 1). One laboratory reported the data measured by two different analytical methods. 25 of the Finnish participating laboratories provide data for use of the Finnish environmental authorities.

About 70 % of the participating laboratories used accredited analytical methods for at least a part of the analytes.

The organizing laboratory (SYKE) has the code 25 in the result tables. For lead the metrologically traceable assigned value has been measured by ID-ICP-MS in SYKE laboratory and the laboratory code is 56.

2.3 Samples and delivery

The preparation of the samples is presented in more detail in Appendix 2.

In the PT three different artificial samples were delivered. The sample A1M was diluted from standard reference material NIST 1643e, resulting in concentration levels suitable for ICP-MS/GAAS measurement. The sample A2M was prepared using single element Merck Certipur RM solutions and concentration levels were higher than in sample A1M, making ICP-OES or FAAS measurements possible. The sample A1Hg was diluted from the Romil CRM Hg-solution. The artificial samples were acidified with nitric acid (Note! Contrary to usual practice the sample A1M was acidified by 5 ml conc. HNO_3 /100 ml).

Three different types of water samples were delivered to the participating laboratories. The natural water sample N3M was prepared using water collected from the lake Lohjanjärvi in Lohja. The final samples for the tested metals, with the exceptions of Cu, were prepared by addition of single element standard solutions in the natural water to increase the metal content in water (Appendix 2). The sample V4M was municipal waste water with additions of single element standard solutions except for Al, Co, Cu, Fe, Mn, Ni and Zn. The third samples were industrial waste water T3Hg for Hg measurements and the sample TN/TY5 for measurements of other metals. These samples were prepared with additions of single element standard solutions, except for Cu and Fe (Appendix 2). The water samples were acidified with nitric acid (Appendix 2). The purity of the laboratory vessels used in the sample preparation was checked. According to the test the used sample vessels fulfilled the purity requirements.

The tested sediment was a combination of estuary sediments of the Baltic Sea from several locations. The sediment was freeze dried, homogenized and divided into subsamples using a vibrating feeder distributor.

The samples were delivered 27 April 2010. Mercury was requested to be measured 30 April 2010 at the latest. All the samples were requested to be analysed and reported 25 August 2010 at the latest.

2.4 Homogeneity studies

The homogeneity of the samples was studied by measuring Cd, Cu, Mn, Zn (waters and sediment), Hg (water and sediment) and P, S (sediment). According to the homogeneity test results the samples were considered to be homogenous. More detailed information of homogeneity studies is in Appendix 3.

2.5 Comments sent by the participants

The comments from the participants are in Appendix 4.1. The comments mainly deal with the errors with reporting of the results. The comments from the provider to the participants are shown in Appendix 4.2. These are mainly focused to the lacking conversancy to the given information with the samples.

2.6 Analytical methods

It was allowed to use different analytical methods for the measurements in the PT. The used analytical methods of the participants are shown in more detail in Appendix 5.1.

Mercury

KBr/KBrO₃-, K₂Cr₂O₇-, SnCl₂-, KMnO₄-, HNO₃/KMnO₄-, HNO₃/KMnO₄/NaBH₄ or KMnO₄/K₂S₂O₈ (with HNO₃ and without) -solutions were typically used as the oxidant in mercury analyses from waters at room temperature, in water bath (95 °C) in autoclave (120 - 121 °C) or in microwave oven. Additionally for mercury analyses in sediment also oxygen, nitric acid or aqua regia was used. The sediment sample was digested using a water bath, autoclave, microwave oven or the samples were digested under oxygen flow or measured directly in an instrument using oxygen at high temperature. Mercury was measured mostly using cold vapor CV- AAS instrument. Other methods were for example FIMS (flow injection mercury system based on atomic absorption), AFS (based on fluorescence), ICP-OES or ICP-MS.

Other elements

The industrial waste water was measured without pretreatment (TN5) or after nitric acid digestion (TY5). The results of these samples were evaluated separately.

The sediment sample S6M was digested either by nitric acid (+ hydrogen peroxide) (SN6) or aqua regia (SO6). No other sample pretreatment was reported by the participants. The results of these differently pretreated sediment samples were treated separately.

Heavy metals were mainly measured using FAAS-, GAAS-, ICP-OES- or ICP-MS-techniques. Arsenic was measured mainly using GAAS-, ICP-OES- or ICP-MS-instruments. Only a few laboratories used hydride techniques for measurements of As or Se.

Nitrogen in sediment samples was mainly measured using N-Kjeldahl or equivalent method and by CSN analyzer. Sulfur was measured mainly by CSN analyzer (eg. Leco). Phosphorus in sediment samples was measured mainly by ICP-AES/OES-instrument. Total carbon was measured by CSN analyzer and in few cases TC was calculated using measured LOI (loss on ignition) value.

2.7 Processing of the data

2.7.1 Testing of normality of data, outliers and replicate results

Before the statistical treatment, the data was tested according to the Kolmogorov-Smirnov normality test and the possible extreme values were rejected as the outliers according to the Hampel test. Also before the robust calculation some extreme outliers were rejected in case that the results deviated from the robust mean more than 50 %. The replicate results were tested using the Cochran test. In case that the result has been reported to be lower than detection limit, it has not been included in the statistical calculation of the results (marked as H in the results sheets). More detailed information of the testing and statistical treatment of the PT data is available on the internet in the guide for participating laboratories in SYKE proficiency testing schemes (www.environment.fi/syke/proftest).

2.7.2 Assigned value

The assigned values and their uncertainties are presented in Appendix 6. The calculated concentrations were used as the assigned values for most measurands in the artificial samples.

For the artificial samples the expanded combined uncertainty based on the combination of uncertainties associated with individual operations involved in the preparation of the sample. The main individual resource of the uncertainty was the uncertainty of the concentration in the stock solution.

For the synthetic samples A1M, A2M and A1Hg the calculated concentrations were used as the assigned value with exceptions of aluminium A1M and A2M and iron A1M samples. For lead the metrologically traceable assigned value has been used for samples A1M, A2M, N3M (accredited method), TN5 and V4M. The assigned values for lead in these samples are based on results analyzed by a metrologically traceable isotope dilution ID-ICP-MS method. The method used for analyzing lead by ID-ICP-MS has been accredited for dissolved lead in natural waters in the scope of calibration laboratory (K054; www.finias.fi). For the other samples and measurements the robust mean value was used as the assigned value. In the calculation of robust mean single results were excluded as replicate results were requested (i.e. Labs 5, 24). The uncertainty of the assigned value was calculated using the robust standard deviation of the reported results using the formula presented in Appendix 6. For the metrologically traceable lead results, the uncertainty is the expanded measuring uncertainty of the ID-ICP-MS method.

The uncertainty of the calculated assigned value and the metrologically traceable value for metals in the artificial sample A1M varied between 0.4 and 3 % and for A2M the uncertainty was lower than 3 %. When using the robust mean of the participant results as the assigned value, the uncertainties of the assigned values varied between 1.8 % and 11 % (Appendix 6).

After reporting of the preliminary results no corrections has been done to the assigned values.

2.7.3 Standard deviation for proficiency assessment and z score

The performance evaluation was carried out by using z scores (Appendix 7). The total standard deviation for proficiency assessment used for calculation of the z scores was estimated on basis of the type of the sample, the concentration of the measurand, the results of homogeneity testing, the uncertainties of the assigned values and the long-term variation in former proficiency tests.

In the performance evaluation z scores were interpreted as follows:

$ z \leq 2$	satisfactory results
$2 < z < 3$	questionable results
$ z \geq 3$	unsatisfactory results

The performance evaluation of the participants using calculated z scores is presented in Appendix 8.

The reliability of the assigned value was tested according to the criterion:

$$u/s_p \leq 0.3, \text{ where}$$

u is the standard uncertainty of the assigned value (the expanded uncertainty of the assigned value (U) divided by 2) and

s_p the standard deviation for proficiency assessment (total standard deviation divided by 2).

In the testing of the reliability of the assigned value the criterion was not met in every case, which is indicated by the high uncertainty of the assigned values in the following cases:

- SN6: Cd

The reliability of the target value for total deviation and the reliability of the corresponding z score were estimated by comparing the deviation for proficiency assessment (s_p) with the robust standard

deviation of the reported results (s_{rob}). The criterion $s_{rob} < 1.2 * s_p$ was met in most cases. This criterion was not met for Cu in the sample SN6 and the evaluation of performance is only informative.

For the sample SO6 and measurements of TC in sediment sample the evaluation of performance has not been done due to the low number of participants (from 4 to 5). However, the assigned values were reported as informative with the preliminary results of the PT. In the final report these assigned values have, however, been ignored due to the low number of results. The deviation of selenium results in the sediment sample SN6 was high ($SD_{rob} > 60\%$ and the result estimation was impossible.

3 Results and conclusions

3.1 Results

The results and the performance of each laboratory are presented in Appendix 8 and the summary of the results in Table 1. The summary of z-scores is shown in Appendix 9. The reported results and their uncertainties are presented graphically in Appendix 5.4.

The robust standard deviation of results was lower than 10 % for 62 % of the results and lower than 20 % for 95 % of the results (Table 1). Standard deviations higher than 20 % apply mainly to the sediment sample (SN6, SO6) with a low number of participants with the exception of problems with selenium in sample SN6. There were two populations of selenium results in sample SN6 (mean values ca. 0.5 and 1.3 mg kg⁻¹), which indicates analytical problems in the measurements (see 3.2). The standard deviations of the results in this PT were approximately in the same range as in the previous comparable PT SYKE 4/2009 [5], where the deviations varied from 4.1 % to 37.2 %.

For example sensitivity differences among the used analytical instruments can increase the variability of the results. On the other hand, different sample digestion procedures and the purity of used acids can affect the variability of the results measured from solid samples. Also the use of different analytical instruments can increase the variability of the results.

In this PT the participants were requested to report replicate results for all measurements. The participants reported the replicates with the exception of two laboratories (Labs 5, 24). The results of the replicate determinations based on the ANOVA statistical handling are presented in Table 2.

Table 1. Summary of the results in the proficiency test 3/2010.

where

Ass. val. the assigned value

Mean the mean value

Mean rob the robust mean

Md the median value

SD % the standard deviation as percents

SD rob the robust standard deviation

SD rob % the robust standard deviation as percents

Num of Labs the number of the participants

2*Targ. SD% the total standard deviation for proficiency assessment at the 95% confidence interval (=2*s_p)

Accepted z-val% the satisfactory z values: the results (%), where |z| ≤ 2.

Table 2. Results of the replicate determinations (ANOVA statistics).

Ass. val. - assigned value, Md - median, sw - repeatability standard error, sb - standard error between laboratories, st - reproducibility standard error

In this PT the repeatability (the within-laboratory standard deviation, s_w) was an average from 2 to 5 times lower than the reproducibility (the between-laboratory standard deviation, s_b , Table 2). The summary of the robustness of the methods, the ratio s_b/s_w , is presented in Table 3. The ratio s_b/s_w should not exceed 3 for robust methods. However in Table 3 is seen that in many cases the robustness exceeds the value 3. For sediment samples SN6 or SO6 the ratio s_b/s_w was too high for several metals.

Table 3. The robustness (s_b/s_w) of the replicate results in the PT 3/2010.

3.2 Analytical methods and status to the results

Effect of sample pretreatment on elemental concentrations in waste waters

Elements in waste water were mainly measured from acidified samples without sample pretreatment with the exception of the industrial waste water sample (TN5/TY5). About one half of the laboratories measured the acidified industrial waste water without sample pretreatment (TN5), while the second half of the participants measured the industrial waste water after nitric acid digestion (TY5). The Figure 1 shows the results for samples TN5 and TY5.

The difference between the average concentrations of elements measured by different sample preparation methods was tested using the t-test. The results of the t-test are shown in Appendix 5.2. There was statistically significant difference between arsenic results gained using no pretreatment method (TN5) and nitric acid digested results (TY5).

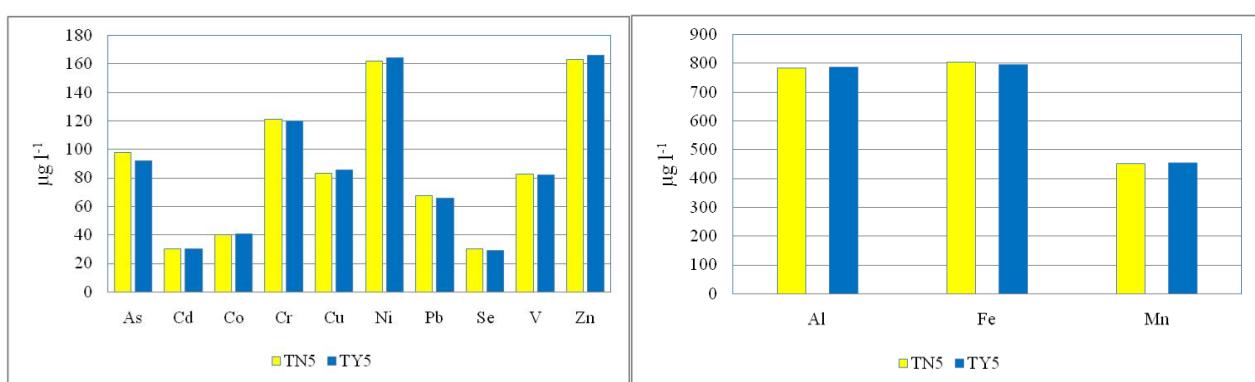

Figure 1. The robust means of measured elements ($\mu\text{g l}^{-1}$) in the industrial waste water sample without sample pretreatment (TN5) and with nitric acid digestion (TY5).

Effect of sample pretreatment on elemental concentrations in sediment

Elements in the sediment sample were measured mainly after nitric acid or nitric acid and hydrogen peroxide digestion (SN6). Only 25 % of the participants digested the sediment sample with aqua regia (SO6). As the number of participants using aqua regia digestion was very low, only from 4 to 5 participants, a more detailed comparison of the sample pretreatment methods is not possible. The robust mean values of both sample pretreatment methods are shown in Table 1. For Cr, Fe and V the robust mean obtained after nitric acid digestion (sample SN6) was 10-15% and for Al about 40% lower than after aqua regia digestion (sample SO6). There was a statistically significant difference (t-test) between aluminium results gained using nitric acid digestion (SN6) and aqua regia digestion (SO6, Appendix 5.2).

Effect of measurement methods on elemental results

The most commonly used analytical method was ICP-OES, followed by ICP-MS and GAAS, while FAAS was used only in a few cases (Appendices 5.1 and 5.3).

The difference between the average concentrations of metals measured by different measurement methods was tested using the t-test. The results of the t-test are shown in Appendix 5.3. There were some statistically significant differences between the results obtained using different methods from some samples. These were as follows:

Measurement methods	Metal/Sample
GAAS/ ICP-OES	Co, V- A2M; Cr, V- TN5
GAAS/ ICP-MS	Se- V4M
ICP-OES/ICP-MS	Al- TN5; As, Co- A2M; Cr-TY5; Pb-SN6
FAAS/ICP-OES	Cu- N3M
CV-AAS/CV-AFS	Hg-A1Hg
Hydride-FIAS/CV-AFS	Hg-A1Hg

The significant differences were most abundant between GAAS and ICP-OES and between ICP-OES and ICP-MS measurements. GAAS results were lower than ICP-MS results for all measurands and sample types (Appendix 5.3). For Al and As ICP-OES results were higher than ICP-MS results, while for Co, Cr and Pb they were lower.

There were two populations of Se results in sample SN6 (mean values ca. 0.5 and 1.3 mgkg⁻¹) and the evaluation was impossible. For Se founded statistically significant difference between the GAAS and ICP-MS results in the sample V4M. Obtaining accurate Se results at this low concentration level is clearly a rather demanding task. Volatilization during sample pretreatment or analysis (e.g. GAAS) may cause loss of analyte, which might explain low recoveries. However, a numerous of reasons may cause results that are erroneously high. Selenium is poorly ionized in an inductively coupled plasma which limits sensitivity even if ICP-MS is used. High carbon concentrations increase the sensitivity of Se in ICP-MS, but this problem is usually encountered in the analysis of organic matrices like biological tissue samples, when measured against aqueous calibration standards low in carbon. This interference cannot be overcome by using collision or reaction cell instruments since it occurs in the plasma, even if the use of said instrumentation is otherwise very beneficial in the determination of Se.

In ICP-MS measurements internal standardization is often used to improve the reproducibility and accuracy since any fluctuations in the sample introduction system during measurement are cancelled out. If matrix effects are to be corrected for, it is important the internal standard behaves similarly to the analyte being corrected. Differences in mass and/or ionization potential may result in a false correction.

Internal standard correction is possible in simultaneous ICP-OES as well, but the choice of internal standard can be more difficult than in ICP-MS, since spectral interferences are often complex in emission spectrometry. The internal standard must not spectrally interfere with the analyte or vice versa. It should also be kept in mind that spectral interferences cannot be corrected for by internal standardization. In addition, the emission lines of the internal standard and the analyte must behave similarly. Ionization and/or excitation potentials should match each other as closely as possible. Simultaneous array spectrometers equipped with solid state detectors are very robust and wavelength stable, thus internal standardization is not a prerequisite to reach good results in environmental samples.

ICP techniques have a longer linear working range compared to AAS. In AAS multiple dilutions may be necessary, which might increase measuring uncertainties. Dilution can be used in ICP

measurements to reduce or eliminate matrix effects if the analyte concentration is high enough.

As a general note, a low recovery may be an indication of loss of analyte which can occur during sample pretreatment (e.g. volatilization during acid digestion) or measurement (e.g. GAAS analysis). It may also be caused by incorrect background correction (ICP-OES) or matrix effects.

Recoveries that are too high may be caused by spectral interferences (overlapping wavelengths in emission spectrometry, polyatomic or isobaric interferences in mass spectrometry), matrix effects or contamination.

Matrix effects can often be overcome by matrix matching the calibration standards, however this is often difficult with environmental samples since the elemental concentrations vary a lot even within the same sample type.

Effect of measurement methods on mercury results

Mercury was determined using various oxidants, digestion and measuring methods (Appendix 5.1). Only about half of the participants reported their methods, due to this the comparison of methods is only informative. From water samples mercury was mainly measured by CV-AAS, followed by CV-AFS, and hydride-FIAS methods (Appendix 5.4). According to the statistical treatment (t-test) the significant difference was evident only when comparing the results between CV-AAS and CV-AFS and between hydride-FIAS and CV-AFS measurements from the sample A1Hg. The difference in the results is more likely coming from different sample pretreatment procedures than different methods. And since the number of the results was very low (CV-AFS n=6 and hydride-FIAS n=3), the reliable estimation of significance difference cannot be made.

3.3 Uncertainties of the results

At maximum about 65 % of participants reported the expanded uncertainties with their results for some measurements (Table 4, Appendix 10). The range of the reported uncertainties varied greatly between the measurements and the sample types. Very low uncertainties can be considered questionable, if lower than the repeatability (the within-laboratory standard deviation, s_w , Table 2).

Several approaches were used for estimating of measurement uncertainty (Appendix 10). The approach based on existing IQC data (Meth 2), validation data (Meth 3) or CRM data (Meth 4) were most common. Generally, the approach for estimating measurement uncertainty has not made a definite impact on the uncertainty estimates. It is evident that harmonization in the estimating of uncertainties should be continued.

Table 4. The range of the expanded measurement uncertainties reported with the results by the participants in the PT3/2010.

Metal	A1M/A1Hg %	A2M %	N3M/N3Hg %	V4M %	TN5/T5Hg %	TY5 %	SN6 %

4

Evaluation of performance

The evaluation of performance is based on z scores. The calculated z scores are presented with the results of each participant in Appendix 8 and the summary of z scores is presented in Appendix 9.

The total number of laboratories participating in this PT was 54, of which one laboratory reported results by two different analytical methods (56 laboratories shown in Appendix 7). The robust standard deviation of the results was mostly (95 % of the results) lower than 20 %.

In the artificial sample A1M the concentrations were low. Accepting deviations of 15–30 % from the assigned values for A1M 79 % of results were satisfactory. There were more difficulties in the measurement of Zn, where less than 70 % of results were satisfactory. On the other hand, in the measurement of Co over 90 % of the results were satisfactory. For Fe in the sample A1M only 70 % of results were satisfactory. The reason to the low percentage might be that the participants have not noticed the information of the sample acidification given by the provider, which may have influenced the measurements. In the measurements of the artificial sample A2M the concentrations were fairly high and 86 % of the results were satisfactory, when accepting deviations of 10–20 % from the assigned value. The number of satisfactory results was lower than 80 % for Cr, Cu and Mn.

For the natural water sample N3M 87 % of the participants gained satisfactory results, when deviations of 15–25 % from the assigned value were accepted. For Fe and V all results were satisfactory, while for Se less than 80 % of the results were satisfactory.

For the waste water samples (V4M and TN5/TY5) 93 % of the results were satisfactory, when deviations of 10–25 % from the assigned value were accepted. For As, Co, Cr, Ni and V all results were satisfactory at least for one sample type. For the industrial waste water TN5 without sample pretreatment 93 % of the results were satisfactory. After sample pretreatment for the sample TY5 also 93 % of the results were satisfactory.

On average the least satisfactory results were gained for Hg from all sample types (70–83 %), when accepting deviations of 20–25 % from the assigned value. The high variety of measuring and pretreatment techniques used by the laboratories creates differences in analysis results.

The results of the sediment sample SO6 was not evaluated due to the low number of participants. The same applies to TC in the sediment. The result of Se was not evaluated due to the high deviation between the results. For the sediment sample deviations of 15 - 25 % from the assigned value were accepted. 87 % of the results obtained after nitric acid digestion (SN6) were satisfactory. The most difficult elements to be measured seemed to be Cd, Pb and Hg from the sediment sample after nitric acid digestion, where less than 80 % of the results were satisfactory.

In total, 87 % of the results in this proficiency test were satisfactory. About 60 % of the participants used accredited methods and 87 % of their results were satisfactory. SYKE arranged a similar proficiency test in 2009 and then 87 % of the results were satisfactory [5].

5 SUMMARY

Finnish Environment Institute (SYKE) carried out the proficiency test for analysis of elements in waters and sediment in April–August 2010. The measured analytes were: Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, Zn, N, P, S and TC. In total 54 laboratories participated in the proficiency test. The sample types were: artificial and natural water, municipal and industrial waste water and sediment.

The calculated concentrations or the robust mean of the results reported by the participants were used as the assigned values for measurands, with the exception of Pb in water samples. For Pb metrologically traceable assigned values were used for samples A1M, A2M, N3M, TN5 and V4M. The uncertainties of the calculated assigned values and metrologically traceable values were 3 % or less. The uncertainties of the consensus assigned values (the robust mean) varied from 1.8 % to 11 %.

The evaluation of the performance of the participants was carried out using z scores. In some cases the evaluation of the performance was not possible e.g. due to the low number of participants. In total, 87 % of the results in this proficiency test were satisfactory when deviations of 10–30 % from the assigned values were accepted. Over half of the participants used accredited methods and 87 % of their results were satisfactory.

6 YHTEENVETO

Suomen ympäristökeskuksen laboratorio järjesti päävyyskokeen ympäristönäytteitä analysoiville laboratorioille kesällä 2010. Päävyyskokeessa määritettiin synteettisestä näytteestä, kolmesta erityyppisestä vesinäytteestä sekä sedimenttinäytteestä seuraavat alkuaineet: Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, ja Zn, Lisäksi sedimenttinäytteestä pyydettiin määrittämään N, P, S ja TC.

Päävyyskokeeseen osallistui yhteensä 54 laboratoriota, joista kaksi laboratoriota raportoi kahdella eri menetelmällä analysoidut tulokset. Laboratorioiden päävyyden arvointi tehtiin z-arvon avulla ja sen laskemisessa käytetyn kokonaishajonnan tavoitearvot olivat välillä 10–30 %. Mittaussuureen vertailuarvona käytettiin pääsääntöisesti laskennallista pitoisuutta tai osallistujien ilmoittamien tulosten robustia keskiarvoa. Lyijyllle käytettiin metrologisesti jäljitettäväksi tavoitearvoa. Tavoitearvon epävarmuus synteettisille näytteille ja metrologisesti jäljitettävälle arvolle oli pienempi kuin 3 % ja robustia keskiarvoa käytettäessä tavoitearvon epävarmuus vaihteli 1.8 %

11 % välillä. Sedimenttinäytteen kaikkia tuloksia ei voitu arvioida, koska testiin osallistuneiden lukumäärä oli alhainen tai tulosten välinen poikkeama oli suuri.

Eri analyysimenetelmillä saatujen tulosten pitoisuksissa esiintyi jonkin verran merkitseviä eroja varsinkin vesinäytteiden määrittämisessä. Erot eivät olleet kuitenkaan systemaattisia jonkin tietyyn menetelmän suhteen.

Koko tulosaineistossa hyväksyttäviä tuloksia oli 87 %, kun vertailuarvosta sallittiin 10–30 %:n poikkeama. Yli puolet osallistujista käytti akkreditoituja määritysmenetelmiä ja näistä tuloksista oli hyväksyttäviä 87 %.

APPENDIX 2 PREPARATION OF THE SAMPLES

The artificial sample A1M was prepared by diluting the SRM NIST 1643e with acidified water (1:10). The artificial sample A2M was prepared by mixing some separate Merck Certipur RM metal solutions and diluting with acidified water. The artificial sample A1Hg was prepared by diluting the CRM Romil Hg solution with acidified water. The water samples N3M, V4M, T5M (TN5/TY5) and N3Hg were prepared by adding some separate metal solutions into the original water sample. The sediment sample S6M (SN6/SO6/ST6) was prepared by combining various dried estuary sediments of the Baltic Sea and homogenization the mixture sediment sample.

S/S6M	6770	7.5	508	43.7	0.09	Yes	51.3	2629	49022	Yes
Zn/S6M	181.6	5	9.08	1.49	0.16	Yes	1.06	1.12	17.71	Yes

$s_p\%$ = standard deviation for proficiency assessment

s_a = analytical deviation, standard deviation of the results in a sub sample

s_{bb} = between-sample deviation, standard deviation of results between sub samples

$$c = F1 \cdot s_{all}^2 + F2 \cdot s_a^2$$

where:

$$s_{all}^2 = (0.3s_p)^2$$

F1 = 1.88 and

F2 = 1.01, when the number of sub samples is 10

The analytical deviation filled up the criteria $s_a/s_p < 0.5$ for each sample and analyte. Also in the each case the s_{bb}^2 was smaller than the criteria c.

Conclusion: The samples could be regarded as homogenous.

APPENDIX 4.1 COMMENTS SENT BY THE PARTICIPANTS

Laboratory	Comments on samples	Action/SYKE
22	The concentrations of metals were too low for the AAS-measurements.	From the participant has asked by email, which sample and metals the comment stand for. The participant has not given any reply.
International participants	In the letter sent with the samples to the foreign participants, was erroneously mentioned Sb to be measured from the sediment sample (S6M).	To the participants sent information from this issue by email.

Laboratory	Comments on results	Action/SYKE
1	The results of Cr were reported also for Cu.	<p>The Cu results were: $2.15 \mu\text{g l}^{-1}$ in A1M, $57.5 \mu\text{g l}^{-1}$ in A2M, $11.9 \mu\text{g l}^{-1}$ in N3M, $10.4 \mu\text{g l}^{-1}$ in V4M, $82.5 \mu\text{g l}^{-1}$ in TN5. The data is not corrected in the original database. If the results should have been reported rightly they should have been satisfactory.</p> <p>The participant can re-calculate z scores according to the guide for participating laboratories in Proftest proficiency testing schemes (www.environment.fi/syke/proftest).</p>
31	The results of N and P in the sediment sample were reported in g kg^{-1} unit, when the right one was mg kg^{-1} .	<p>The results were not corrected in the original database. If the results should have been reported rightly they should have been satisfactory.</p> <p>The participant can re-calculate z scores according to the guide for participating laboratories in Proftest proficiency testing schemes (www.environment.fi/syke/proftest).</p>
7	Error in reporting the results of Pb in the samples N3M and V4M.	<p>The right results were: Pb in N3M $6.885 \mu\text{g l}^{-1}$ and in V4M $3.41 \mu\text{g l}^{-1}$. If the results should have been reported rightly they should have been satisfactory.</p> <p>The participant can re-calculate z scores according to the guide for participating laboratories in Proftest proficiency testing schemes (www.environment.fi/syke/proftest).</p>

APPENDIX 4.2 COMMENTS TO THE PARTICIPANTS

Laboratory	Comments on results
5, 24	Laboratories reported only one result, though replicate results were requested. These results were not included in the calculation of assigned values.
5	The laboratory has reported the measurement uncertainties as $\pm \mu\text{g/l}$ instead of UC %. The values were corrected by the provider.
7	The laboratory has reported the measurement uncertainties UC % by formulas, which were excluded from the handling.
-	From the Fe results in the sample A1M was seen that all participants have not read the information about the sample preparation (acidification) in the letter sent with the samples.
-	Fewer errors than previously were found in the wrongly reported units, which is a good feedback. In the future the wrong unit will be not corrected by the provider, unless the total amount of results is too low for the statistical calculations.

APPENDIX 5.1 ANALYTICAL METHODS

Hg/Pretreatment/Measurement:

Lab ¹⁾	Sample	Oxidant/reducing	Equipment and temperature in digestion	Measurement
1	A1Hg-T5Hg	KMnO ₄ /K ₂ S ₂ O ₈ HNO ₃ /H ₂ SO ₄		CETAC M-6000A
10	A1Hg, T5Hg	SnCl ₂	Microwave digestor: Alton Para Multiwave 30000Solv	Perkin Elmer FIMS 100
	S6M	SnCl ₂	Microwave digestor: Alton Para Multiwave 30000Solv	Perkin Elmer FIMS 100
11	A1Hg-T5Hg	KMnO ₄ /K ₂ S ₂ O ₈	Water bath 95°C +/- 3°C	CV-AAS
	S6M	HNO ₃	Microwave oven MARS5	CV-AAS
12	T5Hg	HNO ₃	Microwave oven CEM. Mars5 175°C	CV-AAS
	S6M	HNO ₃ /HCl	Microwave oven CEM. Mars5 175°C	CV-AAS
14	N3Hg	K ₂ Cr ₂ O ₇	Microwave digestion, T-max = 175°C	CV/AFS
	S6M	Aqua regia	Microwave digestion, T-max = 150°C	CV/AFS
18	A1Hg, T5Hg	SnCl ₂	Autoclave 121°C	Hydride generation / FIAS
	S6M	SnCl ₂	Autoclave 121°C	Hydride generation / FIAS
21	A1Hg			ICP-OES
	S6M	HCl+HNO ₃	Microwave oven 175°C	ICP-OES
22	A1Hg, N3Hg	HNO ₃		CV-AAS
	T5Hg	KMnO ₄	Water bath 95°C	Oxidation with O ₂ + AAS
	S6M	KMnO ₄	Water bath 95°C	Oxidation with O ₂ + AAS
26	A1Hg, N3Hg	HNO ₃ KBr/KBrO ₃		CV/AFS
	T5Hg	HNO ₃ KBr/KBrO ₃	Microwave oven closed vessels, 100°C	CV/AFS
	S6M	HNO ₃	Microwave oven closed vessels, 100°C	Oxidation with O ₂ + AAS
31	A1Hg-T5Hg	KMnO ₄	Direct measuring	CV-AAS
	S6M	O ₂	Milestone DMA80: drying 300°C and combustion 850°C	Oxidation with O ₂ + AAS
32	A1Hg-T5Hg	HNO ₃		ICP-MS
	S6M		Mikrowave oven	ICP-MS
33	A1Hg-T5Hg	KBr/KBrO ₃	Room temperature 30 min.	CV/AFS
35	A1Hg, T5Hg	KMnO ₄ /HNO ₃ / K ₂ S ₂ O ₈	Water bath 95°C 2 h	CV-AAS

1. Samples A1M and A2M the uncertainty was estimated on the basis of the sample preparation.
2. Other samples – the uncertainty was estimated using the data of the results as follows:

$$U\% = \frac{100 \times \left(\frac{2 \times 1.25 \times s_{rob}}{\sqrt{n}} \right)}{AV}$$

where:

U% = the expanded uncertainty of the assigned value

n = the number of the results

s_{rob} = the robust standard deviation

AV = the assigned value

APPENDIX 7 TERMS IN THE RESULT TABLES

Results of each participants (Appendix 8)

Sample	<i>the code of the sample</i>
z-Graphics	z score - the graphical presentation
z score	calculated as follows: $z = (x_i - X)/s_p$, where x_i = the result of the individual laboratory X = the reference value (<i>the assigned value</i>) s_p = the target value of the standard deviation for proficiency assessment
Outl test OK	yes - the result passed the outlier test H = Hampel test (a test for the mean value) In addition, in robust statistics some results deviating from the original robust mean have been rejected
Assigned value	the reference value
2* Targ SD %	the target value of total standard deviation for proficiency assessment (s_p) at the 95 % confidence level, equal $2 * s_p$
Lab's result	the result reported by the participant (the mean value of the replicates)
Md.	Median
Mean	Mean
Robust mean	Robust mean
SD	Standard deviation
SD%	Standard deviation, %
SD %rob	Robust standard deviation, %
Passed	The results passed the outlier test
Missing	i.e. $< DL$
Num of labs	the total number of the participants

Summary on the z scores (Appendix 9)

S – satisfactory ($-2 \leq z \leq 2$)

Q – questionable ($2 < z < 3$), positive error, the result deviates more than $2 * s_p$ from the assigned value

q – questionable ($-3 > z < -2$), negative error, the result deviates more than $2 * s_p$ from the assigned value

U – unsatisfactory ($z \geq 3$), positive error, the result deviates more than $3 * s_p$ from the assigned value

u – unsatisfactory ($z \leq -3$), negative error, the result deviates more than $3 * s_p$ from the assigned value

Robust analysis:

The items of data is sorted into increasing order, $x_1, x_2, x_i, \dots, x_p$.

Initial values for x^ and s^* are calculated as:*

$$X^* = \text{median of } x_i \quad (i = 1, 2, \dots, p)$$

$$s^* = 1.483 \text{ median of } |x_i - x^*| \quad (i = 1, 2, \dots, p)$$

$$\begin{aligned} x_i^* &= x^* - \varphi && \text{if } x_i < x^* - \varphi \\ x_i^* &= x^* + \varphi && \text{if } x_i > x^* + \varphi \\ x_i^* &= x_i && \text{otherwise} \end{aligned}$$

The new values of x^ and s^* are calculated from:*

$$x^* = \sum x_i^* / p$$

$$s^* = \sqrt{1.134 \sum (x_i^* - x^*)^2 / (p-1)}$$

The robust estimates x^ and s^* can be derived by an iterative calculation, i.e. by updating the values of x^* and s^* several times, until the process converges.*

Ref: Statistical methods for use in proficiency testing by inter laboratory comparisons, Annex C [3].

APPENDIX 10. EXAMPLES OF MEASUREMENT UNCERTAINTIES REPORTED BY THE LABORATORIES

For evaluation of the measurement uncertainty the participants have used the procedures as follows:

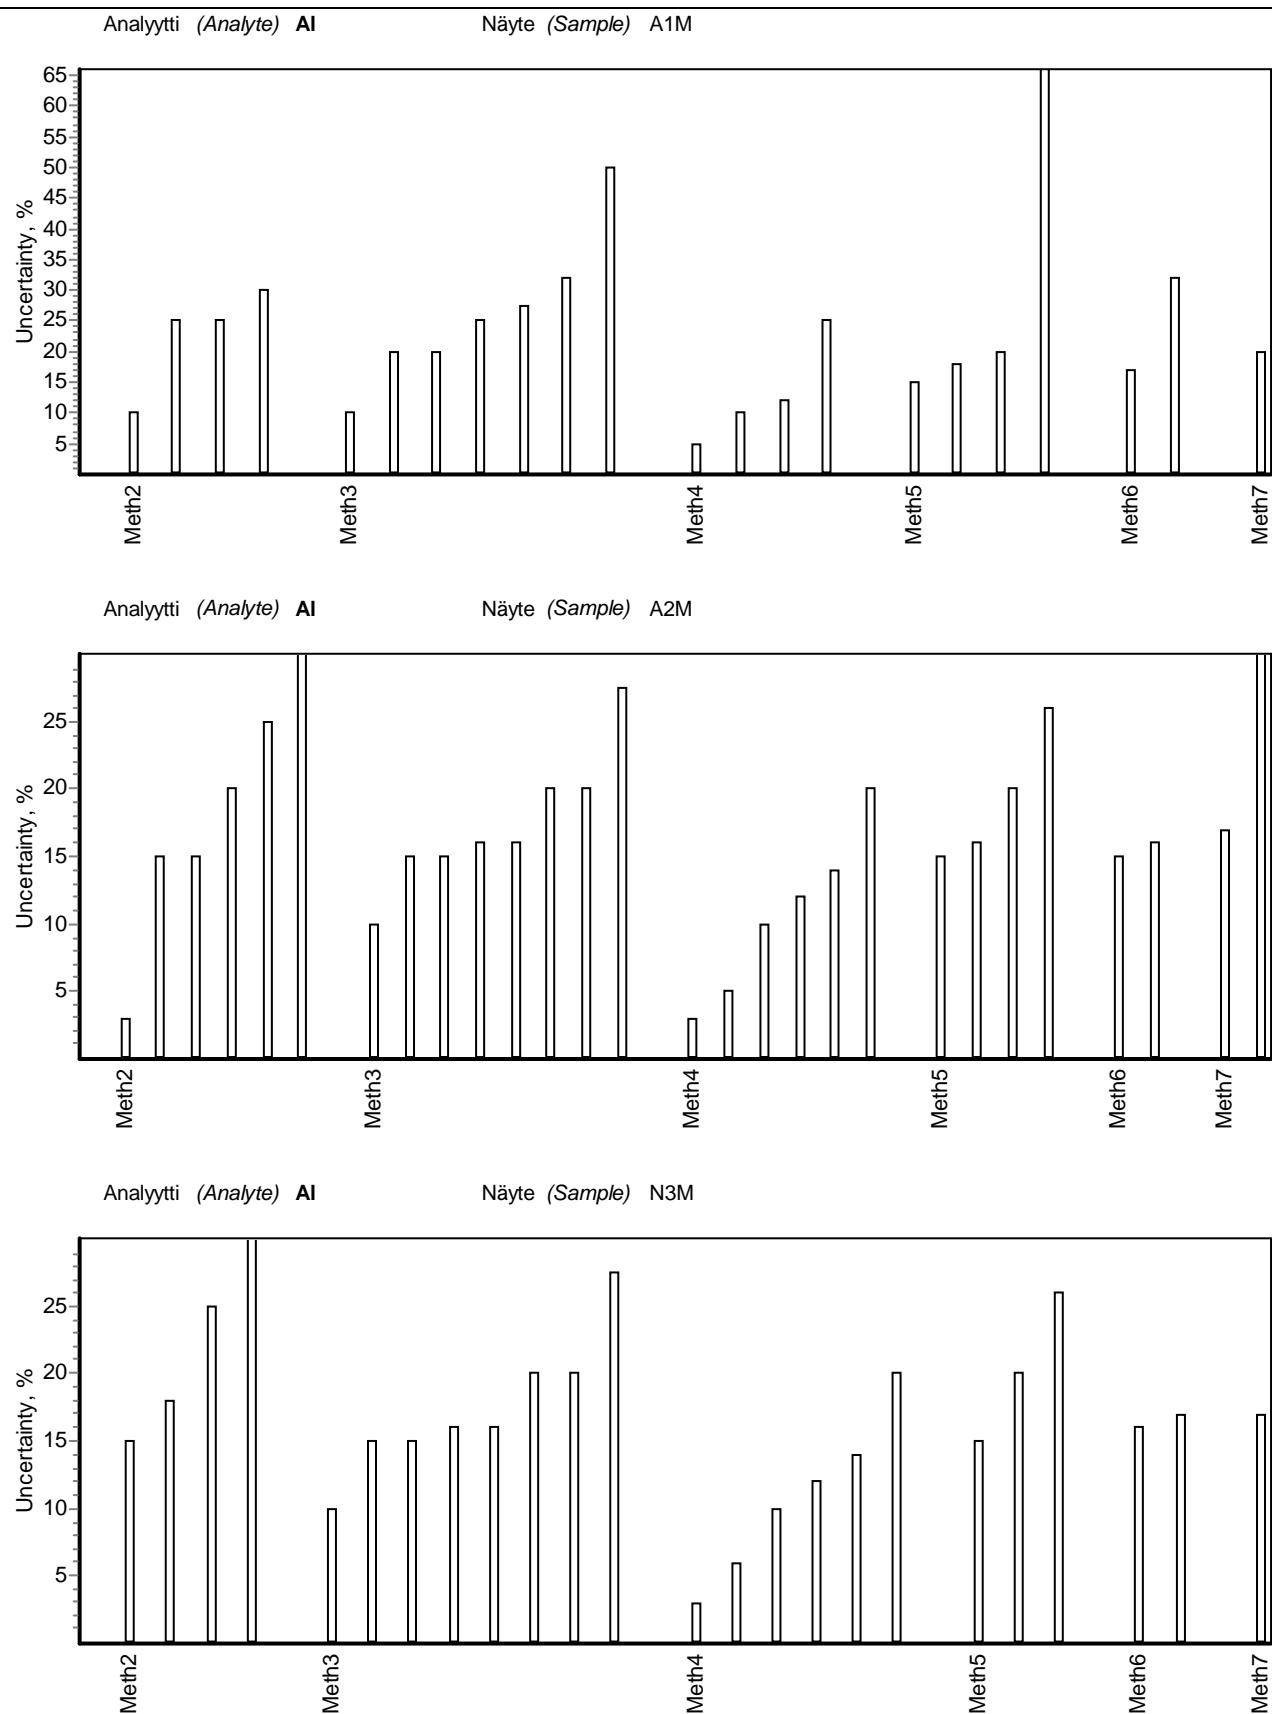

In the figures the procedures have been presented using the same code number.

1. using the variation of the results in X chart (for the artificial samples)
2. using the variation of the results in X chart and the variation of the replicates (r%- or R- chart for real samples)
3. using the data obtained in method validation and IQC, see e.g. NORDTEST TR 537¹⁾
4. using the data obtained in the analysis of CRM (besides IQC data). see e.g. NORDTEST TR 537¹⁾
5. using the IQC data and the results obtained in proficiency tests. see e.g. NORDTEST TR 537¹⁾
6. using the "modelling approach" (GUM Guide or EURACHEM Guide Quantifying Uncertainty in Analytical Measurements²⁾
7. other procedure
8. no uncertainty estimation

IQC= internal quality control

Title of publication	Proficiency test SYKE 3/2010 Metals in water and sediment	
Parts of publication/ other project publications	The publication is available only in the internet www.ymparisto.fi/julkaisut .	
Abstract	<p>The Finnish Environment Institute (SYKE) carried out the proficiency test for analysis of metals in waters and soil in April–August 2010. The measured analytes were: Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, Zn, N, P, S and TC. In total 54 laboratories participated in the proficiency test. The sample types were: artificial and natural water, municipal and industrial waste water and sediment.</p> <p>Basically, the calculated concentrations or the robust mean of the results reported by the participant were used as the assigned values for measurands. The evaluation of the performance of the participants was carried out using z score. In some cases the evaluation of the performance was not possible e.g. due to the low number of the participants. In total, 87 % of the total data in this proficiency test were satisfactory when the deviations of 10–30 % from the assigned values were accepted.</p>

Julkaisun nimi	SYKE Proficiency Test 3/2010 Metals in waters and sediment	
Julkaisun osat/ muut saman projektin tuottamat julkaisut	Julkaisu on saatavana vain internetistä. www.ymparisto.fi/julkaisut	
Tiivistelmä	<p>Suomen ympäristökeskuksen laboratorio järjesti pätevyyskokeen ympäristönäytteitä analysoiville laboratorioille kesällä 2010. Pätevyyskokeessa määritettiin synteettisestä näytteestä, kolmesta erityyppisestä vesinäytteestä sekä sedimenttinäytteestä seuraavat metallit: Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, ja Zn. Lisäksi sedimenttinäytteestä pyydettiin määrittämään N, P, S ja TC.</p> <p>Pätevyyskokeeseen osallistui yhteensä 54 laboratoriota, joista yksi raportoi kahdella eri menetelmällä analysoidut tulokset. Laboratorioiden pätevyyden arvointi tehtiin z-arvon avulla. Mittaustulosten vertailuarvona käytettiin pääsääntöisesti laskennallista pitoisuutta tai osallistujien ilmoittamien tulosten robustia keskiarvoa.</p> <p>Koko tulosaineistossa hyväksyttäviä tuloksia oli 87 %, kun vertailuarvosta sallittiin 10–30 %:n poikkeama.</p>	
Asiasanat	vesianalyysi, metallit, Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, Zn, N, P, S, TC, vesi- ja ympäristölaboratoriot, pätevyyskoe, laboratorioiden välinen vertailumittaus

Utgivare	Finlands Miljöcentral (SYKE)		Datum Januari 2011
Författare	Mirja Leivuori, Kaija Korhonen, Timo Sara-Aho, Teemu Näsänen, Olli Järvinen, Keijo Tervonen, Sari Lanteri och Markku Ilmakunnas		
Publikationens titel	Provningsjämförelse 3/2010 Metaller i vatten och sediment		
Publikationens delar/ andra publikationer inom samma projekt	Publikationen finns tillgänglig på internet www.ymparisto.fi/julkaisut		
Sammandrag	<p>Under April-Augusti 2010 genomförde Finlands Miljöcentral en provningsjämförelse, som omfattade bestämningen av Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, Zn, N, P, S, TC i vatten och sedimenten. Tillsammans 54 laboratorier deltog i jämförelsen.</p> <p>Som referensvärde av analytens koncentration användes mest det teoretiska värdet eller robust medelvärdet av deltagarnas resultat. Resultaten värderades med hjälp av z-värden. I jämförelsen var 87 % av alla resultaten tillfredsställande, när total deviation på 10–30 % från referensvärdet accepterades.</p>		
Nyckelord	vattenanalyser, metaller, Al, As, Cd, Co, Cr, Cu, Fe, Mn, Ni, Pb, Se, V, Zn, N, P, S, TC, sediment, provningsjämförelse, vatten- och miljölaboratorier
