## ERRATA

### Additional information

- page 18 line 23 NTU refers to nephelometer transmission units.
- page 20 line 27 MPN refers to a most probable number estimate of numbers of bacteria.
- section 3.4 page 42. Water samples were not filtered to remove Celite. Removal of Celite by centrifugation could have resulted in loss of bacteria from the suspending water and underestimation of numbers of surviving (viable) bacteria.
- section 4.5 page 75 line 12. *following* "... initial cell numbers" insert "(see page 54 also Table 4.4)"
- Appendix F page 96. *following* the summary table insert "The summary table shows clearly that the water flow in the UV unit is turbulent."

### Corrections

- page 2 line 11,12; page 6 line 6; page 22 line 15; page 41 line 5 and 6; page 62 Table 4.5 change "absorption" to "absorbtion".
- page 4 line 15 change "... of the efficacy of disinfection systems is the total viable faecal numbers of coliform bacteria." to "... of the efficacy of disinfection is the total number of viable faecal coliforms in the system."
- page 8 Figure 2.3 change "thymidine" to "thymine"
- page 18 second dot point change ".. afford protection ..." to "... are protected ..."
- page 22 line 2 change "... clumps larger than 70  $\mu$ m caused a major obstacle to inactivating more than ..." to "... clumps larger than 70  $\mu$ m restricted inactivation to ..."
- page 23 line 22 *following* "... 2 to nearly 8" insert "... 2 to nearly 8 log<sub>10</sub>"
- page 51 last sentence *following* "... from 0.074% to 0.26% ..." should read "... from 0.074 to 0.026% ..."

### Typographical errors

- page 2 second dot point no italics for "and"
- page 2 third dot point no italics for "transmittance"
- page 15 second sentence delete "that"
- page 16, 20, 24 "Schieble *et al.* 1986" should read "Schieble 1986"
- page 18 second dot point no italics for "clumping"
- page 41 line 10 "Mann, 1992" should read "Mann & Cramer, 1992"
- page 59 para. 2 line 4 "Qualls *et al.* 1985" should read "Qualls *et al.* 1989" and "Job *et al.* 1995" should read "Job & Realey"
- page 111 "and" and not "aand"

### Order of References

Sabotka 1992 should be listed before Sobotka 1993, *also* Cairns 1993 before Cairns 1995

## SUMMARY

Irradiation with ultraviolet light is an effective means for disinfection of contaminating bacteria in potable water and waste-water. However high levels of turbidity and suspended solids (SS) can limit UV efficacy. Little quantitative data however are available. To obtain robust and quantitative data on the influence of UV absorption and SS on UV disinfection an experimental study using commercial disinfection technology was undertaken. The acquisition of data is justified by an increased confidence in application and understanding and as a necessary step to process optimisation.

A commercial disinfection unit (UV-LC5™ from Ultraviolet Technology of Australasia P/L) was operated with a range of feed water flow rates (1 - 4 L min<sup>-1</sup>) and which contained either *Escherichia coli* ATCC 25922 or *Pseudomonas aeruginosa* as selected test micro-organisms. *E. coli* was selected because this is found in sewage or water contaminated by faecal material, is used as an indicator for presence of other enteric pathogens and it should be absent in potable water. *P. aeruginosa* was used as a test bacterium primarily because it has DNA comprising relatively high molar ratios of guanine (G) and cytosine (C) and is therefore more resistant to inactivation by UV light than *E. coli*. UV dosage (6,500 - 25,000 μW.s.cm<sup>-2</sup>) was altered by controlling the flow rate of feed water into the disinfection unit. The transmittance of feed water (at 254 nm) was adjusted by addition of a UV absorbing agent (International Roast™ coffee-powder), or by adjusting turbidity using diatomaceous earth as a suspended solid (SS) (Celite 503™ - 0.01 to 0.1 g L<sup>-1</sup>, median particle size of 23 μm).

Reductions in the number of viable bacteria of between 3 log<sub>10</sub> and 5 log<sub>10</sub> were obtained. Survival of the test micro-organisms was greatest at the highest flow rates used and inversely proportional to UV transmittance of the feed tank water, irrespective of the method by which transmittance was adjusted. However, at equivalent transmittance, Celite provided greater protection against disinfection than addition of a UV absorbing agent. In both dark and light storage post irradiation, the re-growth and repair rate of *E. coli* was greater than for *P. aeruginosa*. Following a six (6) day storage the number of *E. coli* reached nearly 25% of the initial number in un-irradiated water. This work highlights the impact of water quality on the use of small scale UV disinfection units for preparation of potable water, where operating parameters should be based on a knowledge of the presence of soluble UV absorbing agents and of SS.

## ACKNOWLEDGMENTS

I would like to express my sincere appreciation to the many people who provided assistance during the course of this investigation. In particular, I am grateful to the following:

*from the Department of Chemical Engineering, University of Adelaide*

Dr. Kenneth Davey, my supervisor, for his guidance, encouragement and fruitful discussions

Technical officers, Mr. Brian Mulcahy and Robert Andrew Wright, for their skilled assistance in constructing apparatus

Mr. Ben Daughtry for his kind help with experimental data analyses.

*from the Department of Microbiology and Immunology, University of Adelaide*

Dr. Connor Thomas, my supervisor, for his guidance, valuable discussion and helpful advice on the microbiological aspects of the project

Ms. Rebecca Pinyon and Mr Shuguang Zhang, who gave help and advice.

*from Ultraviolet Technology of Australasia Pty. Ltd. (UVTA P/L)*

Mr. Tony Gardner, Managing Director UVTA P/L, for generously supplying the UV disinfection unit and co-supervision during the initial stages of the investigation

Mr. Wayne Bradford for his technical assistance.

I hope that the results of my efforts justify the expectations and confidence of the people concerned, and the interest, help, and encouragement of my family, friends and colleagues.

# TABLE OF CONTENTS

<b>SUMMARY</b>	<b>iii</b>
<b>ACKNOWLEDGMENTS</b>	<b>iv</b>
<b>CHAPTER 1: INTRODUCTION</b>	<b>1</b>
<b>CHAPTER 2: LITERATURE REVIEW</b>	<b>4</b>
2.1 Introduction	4
2.2 UV disinfection	4
2.2.1 Sources of UV irradiation	4
2.2.2 Mechanism of UV damage	6
2.2.3 UV disinfection of potable water and waste-water effluents	6
2.3 UV disinfection in combination with oxidants	10
2.4 Inactivation of pathogens by UV irradiation	11
2.5 Effect of some process factors on efficacy of UV disinfection	12
2.6 UV unit design	26
2.7 Economics of UV disinfection	29
2.8 Summary and concluding remarks	30
<b>CHAPTER 3: MATERIALS AND METHODS</b>	<b>32</b>
3.1 UV disinfection unit LC5 <sup>TM</sup>	32
3.2 Flow system	32
3.2.1 Experimental set up	32
3.2.2 Selected bacterial contaminants	37
3.2.3 Absorbing agent and suspended solids	37
3.3 UV inactivation methods	38
3.3.1 Production and harvesting of the test micro-organisms	38
3.3.2 UV inactivation of test micro-organisms	39

3.3.3	Enumeration of viable bacteria using Standard Plate Count Method	39
3.3.4	Determination of UV dose	40
3.3.4.1	UV intensity	40
3.3.4.2	Bioassay method	40
3.3.5	UV transmittance measurement	41
3.3.6	Bacterial repair following UV exposure	41
3.3.7	pH measurement	41
3.4	A typical experiment	42
 <b>CHAPTER 4: RESULTS AND DISCUSSION</b>		<b>43</b>
4.1	UV inactivation of test micro-organisms	43
4.1.1	Review of major experimental data	43
4.1.2	Influence of initial numbers of contaminants	51
4.1.3	Comparison of two test micro-organisms	51
4.2	Effect of UV transmittance and suspended solids	59
4.2.1	Effect of UV transmittance	59
4.2.2	Differentiating between the effect of absorbing agent and suspended solids	59
4.3	Bacterial re-growth following UV exposure	63
4.4	Model synthesis for UV inactivation kinetics	68
4.4.1	Regression analyses	68
4.4.2	Analyses of residual plots	68
4.4.3	Extrapolation of the model for disinfection kinetics	69
4.4.4	Using the kinetic model for UV inactivation	69
4.5	Other observations	75
4.6	Summary of major experimental findings and a comparison with findings of previous work	75
 <b>CHAPTER 5: CONCLUSIONS</b>		<b>77</b>
 <b>RECOMMENDATIONS FOR FURTHER STUDY</b>		<b>78</b>

**APPENDICES**

Appendix A	A definition of some important terms used in this study	79
Appendix B	Disinfection methods used in some countries	80
Appendix C	Calculation of UV intensity	81
Appendix D	Calculation of residence time	88
Appendix E	Microbiological data for inactivation of <i>E. coli</i> and <i>P. aeruginosa</i> in RO water using UV-LC5 unit	89
Appendix F	Reynold number calculations	96
Appendix G	UV-Visible spectra of test micro-organisms with or without the presence of absorbing agent (coffee) or suspended solids (Celite 503)	97
Appendix H	Photographs of UV-LC5 disinfection unit	107
Appendix I	Test for absorption of bacterial cells on Celite 503 and possible biocidal effects of coffee and Celite 503 on test micro-organisms	110
Appendix J	Refereed publications from this investigation	111
