## Abstract:

This paper investigates factors that can explain the motivations of Portuguese companies to a social performance. The study was based on a sample of nineteen large Portuguese companies, listed on the PSI 20 index, for a period of five year, since 2005 to 2009. A Factorial Analysis was applied to identify the dimensions of Portuguese Corporate Social Responsibility using variables reference on the Green Book of European Community Commission (ECC, 2001). The results produced two dimensions that may explain Portuguese corporate motivation social performance: (1) Standards and Legal Requirements and (2) Ethic and social conduct. Further research may be done to find correlations with these dimensions and financial and economic corporate performance.

**Keywords**: Corporate Social Responsibility, Motivations Factors for a Corporate Social Performance, Multivariate Analysis.

#### Introduction

Globalization has increased the economic and financial interdependence of markets and countries, raising awareness about the consequences of a less responsible conduct undertaken by organizations. Society has increased its awareness about the impact of organizations activities, and hopes that they respond to their social demands, if they want to maintain long-term profits. Organizations will be better equipped to develop their business in community, if they contribute positively to that community (Davis, 1973). In this context, Corporate Social Responsibility (CSR) emerge as a way to organizations assume their responsibilities, and is assuming an increasingly importance globally. In the European context, the European Commission has developed several initiatives to promote CSR, but more than that, to put Europe on the path of excellence on CSR.

There are several reasons for this change, for example, corruption cases involving fraudulent accounting, the growing gap between the salaries of top managers and their employees, abusive practices, marketing of products harmful to public health, violation of human rights and environmental standards (Lama & Muyzenberg, 2008).

Other reasons cited are the shift of organizations towards social responsibility relates to the organizational changes and market driven by globalization and technological development (Zadek, 1999), namely "the transparency of business activities brought by the media and by modern information and communication" (ECC, 2001, p.4). Joining this with social responsibility it can become increasingly important, and "the business which vacillates or choose not to enter the arena of social responsibility, may find that it gradually sink into customer and public disfavor" (Davis, 1973, p. 321).

Heal (2004) argues that CSR has a role to play when the market fails through private-social cost differentials, particularly in two situations: (1) when the private economic costs are not aligned with social costs, for example, what is more profitable for the companies is not the best for the welfare of society; (2) when there are strong disagreements to what is perceived as fair by the companies and society. In both situations, the CSR can be used to produce the social welfare. Otherwise, if economic private costs and social cost are in line, CSR has, according to the author, little to add.

In the current context, characterized by social asymmetries, CSR has an important role in bringing the balance that should support a sustainable development. In this research we try to identify the dimensions that may influence the social performance of Portuguese companies, finding what moves companies into CSR.

### 1. Theoretical framework

Despite the evidence of social concerns by companies much before their written conceptualization, CSR emerges as formal written concept, in the United States, in the fifties, with the publication by Howard R. Bowen, entitled "Social responsibilities of the businessman", marking the beginning of modern literature on CSR (Carroll, 1999). In its initial definition, Bowen (1953, quoted in Carroll, 1999) "refers to the obligations of businessmen to pursue policies, to make decisions, or to follow lines of action which are desirable in terms of the objectives and values of our society" (p. 270). According to the author businessmen were responsible for their actions not only with regard to economic performance, but in a broader context as well (Bowen, 1953, cited by Carroll, 1999).

Many definitions and conceptualizations have followed, suggested by an extensive literature, outlining a confusing framework, without unanimity on a universally accepted definition. The World Business Council for Sustainable Development (WBCSD), an organization that combines several international companies, that share commitment to a sustainable development, published in their Social Responsibility Report on 2000, the following definition: "Corporate social responsibility is the commitment of business to contribute to sustainable economic development, working with employees, their families, the local community and society at large to improve their quality of life" (WBCSD, 2000, p.10).

In the European context the first great impetus to the promotion of social responsibility, arise in 1993, through the "call made by President Jacques Delors to these companies to participate in the fight against social exclusion" (ECC, 2001, p.3), which resulted in a large membership. Later, in March 2000, on the Lisbon European Council, the European Union called again to the sense of corporate social responsibility as "regarding best practices on lifelong learning, work organization, equal opportunities, inclusion social and sustainable development" (ECC, 2001, p.3).

In the Green Paper, named "Promoting a European framework for corporate social responsibility", ECC has defined CSR as "a concept whereby companies decide voluntarily to contribute to a fair society and a cleaner environment (...). This responsibility is expressed towards employees and more generally in relation to all stakeholders affected by business and which in turn can influence their results "(ECC, 2001, p.4). ECC (2001), considered the corporate social responsibility in two dimensions, the internal and external dimension, which include several aspects: (1) The internal dimension includes the "Human Resources Management", "Health and Safety at Work" "Adapting to change," and "Management of environmental impacts and natural resources"; (2) The external dimension of CSR includes "local communities", "Business partners, suppliers and consumers," and "Human rights and global environmental concerns" (pp.8-16).

The conceptualization of CSR is yet to achieve a consensus, but for organization to

perform in a social way, we must answer the question "How can and do corporations contribute to constructing 'the good society'? This question itself must be answered in the context of a discussion on corporate social performance -the outcomes of corporate behavior" (Wood, 1991, p. 6). Corporate Social Performance (CSP) uses CSR "as the starting point for corporate social involvement" (Wartick & Cochran, 1985, p.758). To Waddock and Graves (1997) many of the measures used, or are one-dimensional (such as disclosure and social investments in pollution control), and do not reflect all aspects of CSP, or are difficult to apply in a consistent manner to the diversity of industries and companies. They point to the problem of measuring CSP as a major reason for the uncertainty of the results obtained in several studies that examined the relationship between social performance and economic and financial performance.

Different authors (*e.g.*, Griffin & Mahon, 1997; McWilliams & Siegel, 2000; Waddock & Graves, 1997), used indexes for the measurement of social performance, namely the index developed by the rating agency Kinder, Lydenderg, Domini (KLD). Other indexes often used are those based on reputation developed by Fortune and Moskowitz (*e.g.*, Griffin & Mahon, 1997; Orlitzky, Schmidt & Rynes, 2003, Stanwick and Stanwick, 1998; Wood & Jones, 1997).

In Europe, and for German companies, Szekeley and Knirsch (2005) reported that different methods were used by companies to evaluate performance, and that many have adopted the guidelines of the Global Reporting Initiative (GRI), differing, however, on aspects who chose to measure and report. In Portugal, where the practice of CSR in a systematic way is relatively recent, with some lag to most of the other European countries (CECOA, 2004). A recent study refers the difficulties in quantifying and measuring socially responsible practices and advised the need of building measurement models that serve, not only for Portuguese companies to quantify their projects, but also to be able to select the best practices in accordance with sustainability and stakeholder expectations (Leite & Rebelo, 2010).

In this study we defined several variables to assess the social performance, taking into account the multiplicity of aspects that are covered by CSP, and based on the variables defined in the Green Book by ECC (2001), considering as well literature on the theme and the guidelines of the GRI, used by several Portuguese companies that report their social performance. Also we consider the fact that most of the Portuguese companies set their CSR goals according to the three dimensions of the sustainable development (usually call by "*Triple bottom line*"): Economic, Environmental and Social.

### 2. Factors influencing the performance of socially responsible companies

The purpose of this research is to identify and define the dimensions of Portuguese

corporate social responsibility that may influence it social performance. To achieve the goal we chose a sample of Portuguese companies quoted in the Euronext Lisbon stock exchange, that belong to PSI 20 Index, for a period of five years, from 2005 to 2009. The choice was due to the fact that companies listed on Euronext Lisbon, were obliged since 2005 to report their accounts according to International Standards of Accounting and International Financial Reporting Standards (IAS-IFRS standard), therefore those companies could be more predisposed to adopt CSR practices. It was chosen a five years period, that can provide more information about companies commitment with CSR. Like Zadek (2004) argue "companies don't become model citizens overnight" (p. 2), and the effects of a social performance may not be expected in the short term, so a longer period of study is considered to be important. Also the chosen period allows an evolution analysis in the adoption of social responsibilities practices and social performance. The sample under research was composed by 19 Portuguese companies (n=19), that were studied during 5 years, performing a total of 95 observations (n =95).

The variables chosen to measure the multiple dimensions of CSP were based on the aspects mention by ECC (2001) in the Green Book and considering several literature on the issues, and the GRI guidelines (Table 1).

Internal Dimension	External Dimension	Other
Variables	Variables	variables
<ul> <li>Responsible management</li> <li>Human resources management</li> <li>Health and safety at work</li> <li>Environmental and natural resources management</li> <li>Business ethics</li> </ul>	<ul> <li>Local communities</li> <li>Stakeholders</li> <li>Human rights</li> <li>Environmental and philanthropic global concerns</li> </ul>	• CSR instruments

**Table 1.** Variables to measure the Corporate Social Performance.

The analysis and measure of social performance, was done through information's gathered from sustainability and financial reports, available on companies' official websites.

A factor analysis was applied in order to find the dimensions, not directly observable, that may explain what motivates Portuguese companies to a social performance. To apply this it was need to produce the Bartlett's Test of Sphericity in order to verify the existence of correlation between variables and analyse the performance Sampling

Adequacy using Kaiser-Meyer-Olkin Measure (KMO). To extract the dimensions it was used the Initial Eigenvalues and Principal Component Analysis. To identify the contribution of variable to each dimension it was used the Varimax rotation method with Kaiser Normalization.

### 3. Results Discussion

Appling the multivariate analysis it was verified the performance of the sampling adequacy using KMO obtained a 0,852 value, which according the parameterization it can be considered a Good Factor Analysis; and also show that variables under analysis are statistic and significantly correlated by the Bartlett's Test of Sphericity ( $\chi^2$  = 929,486; p-value < 0,01).

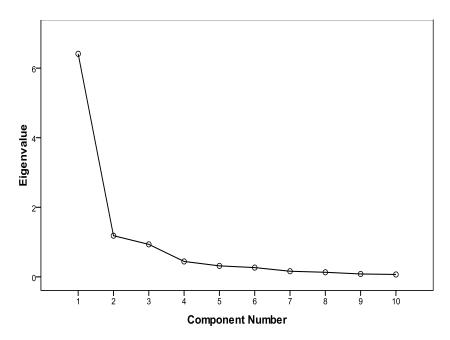

Figure 1. Eigenvalue vs Dimensions Number Scree Plot.

According with the results produced by factor analyze, reported in Table 2, it was possible to extract two dimensions that can explain the Portuguese corporate motivation for a social performance (see Fig. 1).

The Dimension 1, which explains 64.116% of the variance, is defined by the variables Environmental and natural resources management, Health and Safety at Work, CSR instruments and Human Resources Management, which seem to have in common standards and compliance with legal requirements, in particular in which refers to the environment, health and safety, and human resources, and we named **Standards and Legal Requirements**. The variables, Environmental and natural resources management, health and safety at work, present the greatest contributions. This dimension seems to be more relevant to internal policies of

organization in order to comply with regulations and in particular to obtain certifications.

	Dimensions	
	Standards and Legal Requirements	Ethic and social conduct
Environmental and natural resources management	0,933	
Health and safety at work	0,894	
CSR instruments	0,762	
Human resources management	0,662	
Business ethics		0,862
Stakeholders		0,826
Local communities		0,668
Human rights		0,649
Responsible management		0,663
Environmental and philanthropic global concerns		0,456
Eigenvalues	6,412	1,184
% of Variance	64,116%	11,838%

**Table 2.** Dimensions of Portuguese Corporate Social Responsibility.

The second dimension, which explains 11.838% of the variance, is defined by the variables Business Ethics, Stakeholders, Local Communities, Responsible Management, Human Rights, and Environmental and Philanthropic Global Concerns (see Table 2). The variables appear to have in common ethical concerns, good conduct and action in the social sphere, so we named **Ethic and social conduct**. This factor seems to be more relevant in terms of communication with the outside, disclosing an image of ethic and social responsibility. The variable business ethics has the higher weight, which may indicate the importance of transparent and ethical image.

### Conclusions and further research

It seems that social performance by Portuguese companies under analysis are mostly motivated by complying with the regulations and attainment of certifications, perhaps motivated by the interest of avoiding restrictive regulations and pressures by external organizations, especially with environment, health and safety at work, and to obtain certifications. Their Corporate Social Responsibility behaviour it also seems to be slitting encourage, by the opportunity to improve their reputation and especially through an ethic and social responsible image. Findings suggest that social performance is not having the same relevance in its multiple dimensions, but it maybe being used as a strategy to comply with regulations and certifications and to improve their reputation.

This study provides a new framework to measure social performance, based on ten variables providing an extended view of the multiple dimensions of Corporate Social Responsibility. These ten variables contributed to construct two new dimensions to explain the Portuguese Corporate Social Responsibility Practice, since 2005; namely Standards and Legal Requirements and Ethic and Social Conduct. Though the policies and corporate responsible practices of biggest Portuguese companies seems to be driven by legal and standard concerns as well as ethic and social issues.

This findings rise questions like the motivations for adoption of corporate social responsibility practices is related to financial and economic performance. The level of implementation the policies of corporate social responsibility is driven by financial and economic performance concerns. Related to this we suggest that further research can follow a different path, by studying different strategies that organizations are using to achieve a social performance. And if that strategies are influencing economic and financial performance, not only in a direct way (*e.g.*, influencing results) but in an indirect way (*e.g.*, avoiding restrictive regulations and cost with environmental and social demands, or increasing employees motivation and work efficiency). As some previews research found positive relation between financial and economic measures and Corporate Social Performance measures we also suggest applying the same methodology to Portuguese Public Companies.
