

PROOF COVER SHEET

Author(s): Piera Margutti and Paul Drew
Article title: Positive evaluation of student answers in classroom instruction
Article no: 898650
Enclosures: 1) Query sheet
2) Article proofs

Dear Author,

1. Please check these proofs carefully. It is the responsibility of the corresponding author to check these and approve or amend them. A second proof is not normally provided. Taylor & Francis cannot be held responsible for uncorrected errors, even if introduced during the production process. Once your corrections have been added to the article, it will be considered ready for publication.

Please limit changes at this stage to the correction of errors. You should not make trivial changes, improve prose style, add new material, or delete existing material at this stage. You may be charged if your corrections are excessive (we would not expect corrections to exceed 30 changes).

For detailed guidance on how to check your proofs, please paste this address into a new browser window: <http://journalauthors.tandf.co.uk/production/checkingproofs.asp>

Your PDF proof file has been enabled so that you can comment on the proof directly using Adobe Acrobat. If you wish to do this, please save the file to your hard disk first. For further information on marking corrections using Acrobat, please paste this address into a new browser window: <http://journalauthors.tandf.co.uk/production/acrobat.asp>

2. Please review the table of contributors below and confirm that the first and last names are structured correctly and that the authors are listed in the correct order of contribution. This check is to ensure that your name will appear correctly online and when the article is indexed.

Sequence	Prefix	Given name(s)	Surname	Suffix
1		Piera	Margutti	
2		Paul	Drew	

Queries are marked in the margins of the proofs, and you can also click the hyperlinks below.

AUTHOR QUERIES

General points:

1. **Permissions:** You have warranted that you have secured the necessary written permission from the appropriate copyright owner for the reproduction of any text, illustration, or other material in your article. Please see <http://journalauthors.tandf.co.uk/permissions/usingThirdPartyMaterial.asp>.
2. **Third-party content:** If there is third-party content in your article, please check that the rightsholder details for re-use are shown correctly.
3. **Affiliation:** The corresponding author is responsible for ensuring that address and email details are correct for all the co-authors. Affiliations given in the article should be the affiliation at the time the research was conducted. Please see <http://journalauthors.tandf.co.uk/preparation/writing.asp>.
4. **Funding:** Was your research for this article funded by a funding agency? If so, please insert ‘This work was supported by <insert the name of the funding agency in full>’, followed by the grant number in square brackets ‘[grant number xxxx]’.
5. **Supplemental data and underlying research materials:** Do you wish to include the location of the underlying research materials (e.g. data, samples or models) for your article? If so, please insert this sentence before the reference section: ‘The underlying research materials for this article can be accessed at <full link>/ description of location [author to complete]’. If your article includes supplemental data, the link will also be provided in this paragraph. See <<http://journalauthors.tandf.co.uk/preparation/multimedia.asp>> for further explanation of supplemental data and underlying research materials.
6. The **CrossRef database** (www.crossref.org/) has been used to validate the references. Mismatches will have resulted in a query.

- Q1.** AU: Please note that the format of affiliations ‘a’ and ‘b’ has been changed to match the journal format. Please check the affiliations for correctness and amend if necessary.
- Q2.** AU: The terms “teacher evaluation”, “teacher’s evaluation” and “teachers’ evaluation” are used in the text. Please check throughout for consistency and correctness.
- Q3.** AU: Please spell out ‘IRE’ in full at first mention.
- Q4.** AU: The sense of the phrase ‘and for this reason’ in the sentence “However, whilst. . .communicative engagement” is not clear. Please check that it reads correctly and supply a revised version if necessary.
- Q5.** AU: Please provide an institutional e-mail address, if available, to be included in the article, as per journal style.
- Q6.** AU: Please check the sentence “A feature of a traditional type of organization . . .” for completeness and correctness.
- Q7.** AU: Please note that the use of “ibid” is against journal style. Please replace these with the relevant reference details throughout.

- Q8.** AU: Please check edit in the sentence “All of them have encouraged scholars to search . . .” for correctness.
- Q9.** AU: Please advise whether ‘ex.’ should be changed to ‘extract’ or ‘example’ throughout the text.
- Q10.** AU: Please check all the extracts throughout the text as set for correctness.
- Q11.** AU: Please spell out ‘Q–A’ in full at first mention.
- Q12.** AU: Please check edit in the sentence “In line with some recent conversation . . .” for correctness.
- Q13.** AU: The sense of the sentence “Subject consent. . . personal data” is not clear. Please check that it reads correctly and supply a revised version if necessary.
- Q14.** AU: Please check edit in the sentence “Therefore, instead of what is generally referred . . .” for correctness.
- Q15.** AU: The reference [Schegloff, 1996] is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [http://www.tandf.co.uk/journals/authors/style/reference/tf_ChicagoAD.pdf].
- Q16.** AU: Please note that the ‘fn’ has been changed to ‘endnote’. Please check the same for correctness.
- Q17.** AU: Please check the phrase “rush-through” used in the sentence “By contrast, the quality of the repeat . . .” for correctness.
- Q18.** AU: The reference [Schegloff, 1982] is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [http://www.tandf.co.uk/journals/authors/style/reference/tf_ChicagoAD.pdf].
- Q19.** AU: Please check the edits made to the sentence ‘Likewise. . .evaluation token’ for correctness and amend if necessary.
- Q20.** AU: Please check the use of the word “than” in the sentence “No further account is provided . . .” for correctness.
- Q21.** AU: The year in the citation ‘McHoul 1900’ has been changed to ‘1990’ to match the entry in the references list. Please confirm this is correct and provide revisions if needed.
- Q22.** AU: Please check edit in the sentence “In Section 4.1, we have seen that there is a . . .” for correctness.
- Q23.** AU: You have not included an Acknowledgement section. Please either supply one with your corrections or confirm that you do not wish to include one.
- Q24.** AU: Please check the reference citations in endnote 1 as set for correctness.
- Q25.** AU: The year in the citation ‘McHoul 1900’ in the sentence “See also McHoul who observes that . . .” has been changed to ‘1990’ to match the entry in the references list. Please confirm this is correct and provide revisions if needed.
- Q26.** AU: Please check the publisher location in reference “Brice Heath (1983)” as set for correctness.
- Q27.** AU: The reference “Heritage, Douglas, 2006” is listed in the references list but is not cited in the text. Please either cite the reference or remove it from the references list.
- Q28.** AU: Please check the publisher location in reference “Jefferson (2004)” as set for correctness.
- Q29.** AU: Please check the publisher name in reference “Koole (2012)” as set for correctness.

- Q30.** AU: Please provide missing publisher location for the “Mehan, Hugh. 1979” references list entry.
- Q31.** AU: The reference “Schegloff, 2006” is listed in the references list but is not cited in the text. Please either cite the reference or remove it from the references list and also please check the volume number and issue number as set for correctness.

How to make corrections to your proofs using Adobe Acrobat/Reader

Taylor & Francis offers you a choice of options to help you make corrections to your proofs. Your PDF proof file has been enabled so that you can edit the proof directly using Adobe Acrobat/Reader. This is the simplest and best way for you to ensure that your corrections will be incorporated. If you wish to do this, please follow these instructions:

1. Save the file to your hard disk.
2. Check which version of Adobe Acrobat/Reader you have on your computer. You can do this by clicking on the “Help” tab, and then “About”.

If Adobe Reader is not installed, you can get the latest version free from <http://get.adobe.com/reader/>.

3. If you have Adobe Acrobat/Reader 10 or a later version, click on the “Comment” link at the right-hand side to view the Comments pane.
4. You can then select any text and mark it up for deletion or replacement, or insert new text as needed. Please note that these will clearly be displayed in the Comments pane and secondary annotation is not needed to draw attention to your corrections. If you need to include new sections of text, it is also possible to add a comment to the proofs. To do this, use the Sticky Note tool in the task bar. Please also see our FAQs here: <http://journalauthors.tandf.co.uk/production/index.asp>.
5. Make sure that you save the file when you close the document before uploading it to CATS using the “Upload File” button on the online correction form. If you have more than one file, please zip them together and then upload the zip file.

If you prefer, you can make your corrections using the CATS online correction form.

Troubleshooting

Acrobat help: <http://helpx.adobe.com/acrobat.html>

Reader help: <http://helpx.adobe.com/reader.html>

Please note that full user guides for earlier versions of these programs are available from the Adobe Help pages by clicking on the link “Previous versions” under the “Help and tutorials” heading from the relevant link above. Commenting functionality is available from Adobe Reader 8.0 onwards and from Adobe Acrobat 7.0 onwards.

Firefox users: Firefox’s inbuilt PDF Viewer is set to the default; please see the following for instructions on how to use this and download the PDF to your hard drive:

Positive evaluation of student answers in classroom instruction

Piera Margutti^{a*} and Paul Drew^b

^a*Dip. Scienze umane e sociali, Piazza Fortebraccio, Università per Stranieri di Perugia, Perugia, Italy;* ^b*Department of Social Sciences, Loughborough University, Loughborough, United Kingdom*

(Received 15 October 2013; accepted 22 February 2014)

Within the context of teacher/whole-class instruction sequences, researchers have associated teacher evaluation of pupils' answers to forms of traditional pedagogic discourse, also referred to as 'triadic dialogue', 'monologic discourse', 'recitation' and 'IRE sequences'. Teacher evaluation has also been associated with pupils' low levels of participation. Explanations and solutions offered by prior research are mainly based on functional categories of actions, characterizing forms and functions of teacher questions and follow-up moves in IRE sequences. Using Conversation Analysis to investigate collections of positive evaluations in video-recorded lessons in two primary school classes, we propose an interactional explanation of the phenomenon and of its predominant use. We show that teachers systematically select the formats of their positive third-turn receipts not only to evaluate pupils' answers for their abstract truth value, but also with respect to the role of each question–answer in the whole activity. We demonstrate that, in this way, teachers convey judgements about the question within the activity; thus, adding a constitutive property to the pedagogic practice and providing students with interpretive resources for a common understanding of pedagogic goals and procedures.

Keywords: classroom interaction; Conversation Analysis; primary teaching; teacher–student interaction; teacher talk; teacher evaluation

1. Introduction

Teacher evaluation of pupils' answers is one of the most complex, important and controversial issues in research on classroom interaction. On one hand, teachers' third-turn evaluations or 'follow-up moves' (Sinclair and Coulthard 1975) are widely recognized as being at the heart of 'instruction' in Western cultures: adults ask children questions to which they know the answers, then evaluate the correctness, accuracy or appropriateness of children's answers (Sinclair and Coulthard 1975; Mehan 1979; Drew 1981; Brice Heath 1983; Pine 1992; Grosse and Tomasello 2012). However, whilst teachers' evaluations of students' answers seem central to instruction, teachers' evaluating work is also sometimes regarded as the means or mechanism for retaining control over matters of 'correctness' (Drew 1981, 260–261), and for this reason has attracted criticism as the hallmark of conventional pedagogic discourse (also referred to as 'triadic dialogue' and 'recitation'), responsible for engendering pupils' low level of communicative engagement (Mercer 1995; Nassaji and Wells 2000; Nystrand et al. 2003; Alexander 2008; Mercer et al. 2009; Lyle 2008). A feature of a traditional type of organization of classroom interaction known as the IRE model (Sinclair and Coulthard 1975; McHoul 1978; Mehan 1979), teacher evaluations are associated with highly codified test questions, the teacher's

*Corresponding author. Email: pimargy@yahoo.it

role of ‘primary knower’ (Berry 1981; Tsui 1989; Nassaji and Wells 2000), and pupils’ short and unelaborated answers. All of them have encouraged scholars to search for ways to enhance pupils’ level of engagement in pedagogic activities through more dialogic strategies, relying on greater use of ‘genuine’ questions combined with other forms of third-turn receipts such as comments, requests for further information (Nassaji and Wells 2000, 385) and uptakes (Nystrand et al. 2003, 145–147),¹ all of which might contribute to higher levels of pupils’ participation (ibid., 147–148).

However, despite recent measures in education policies encouraging teachers to adopt more innovative and dialogic discourse styles, it appears that the IRE format and third-turn evaluations are still predominantly used in pedagogic activities, especially when teachers are addressing and engaging the whole class (Nassaji and Wells 2000; Mercer et al. 2009; Lyle 2008). It is the very *absence* of the teacher’s evaluation of students’ answers in this first example that highlights what an important part evaluations play; in ex. 1, the teacher’s non-response to the answer *water* (line 4) causes students to revise the answer (line 5), seeking the ‘correct’ answer that the teacher so evidently is looking for (see her repeat of the question in line 7).

(1) Water (PM:ET:2: natural sciences) [From a third-year class in an Italian primary school. T is asking each student in turn to name one component of soil]

- 01 T: [↑cos’è che forma il fan[go
what’s it that makes the mud
what is it that makes mud
- 02 St: [↑uh!
- 03 St: [()
- 04 St: ACQUA!
water
- 05 St: argi[lla
clay
- 06 St: [è l’A::[CQUA::!
it’s water
- 07 T: [da cos’è formato il[fa::ngo
of what (it) is made mud
what is mud made of
- 08 St: [argilla
clay
- 09 Sts: argilla::
clay
- 10 St: ar[gilla
clay
- 11 T: [eh::?
eh²

When the teacher fails to ratify the answer first offered, but instead re-asks the question in line 7 (now in the passive form), more pupils adopt the alternative answer ‘clay’ (e.g. line 9 is produced collectively); they thereby display that they have understood the absence of a direct ratification of ‘water’ (offered in line 4) as indicating that it was incorrect. Hence, the teacher’s third-turn evaluation is not an optional expansion of the Q–A pair in instruction sequences; participants themselves orient to evaluation as an intrinsic part of instruction activity.

However, it is worth emphasizing that by ‘evaluation’ we mean both (1) the *action of evaluating* students’ answers, conveying (even implicitly as in ex. 1) a judgement about the correctness or otherwise of that answer and (2) the production of an evaluation-

dedicated third turn to register, receipt and evaluate the answer as positive or negative, again either directly or indirectly. Our focus here is specifically evaluating students' answers *positively*. Based on observations in an Italian primary school, we show that teachers use a restricted range of practices or techniques to indicate a positive evaluation of students' prior answers. Moreover, the selection from among this range of practices is not random; the evaluative technique or practice is closely connected to the specific type of pedagogic sequence of which it is a constitutive part or element. Therefore, our principal findings are:

- there is a range of five principal practices or techniques by which teachers evaluate an answer to their question as 'correct' and
- these practices are employed differentially, according to the specific kind of pedagogic sequence the teacher is building.

In short, we report the systematic associations between the various (positive) evaluation formats and the broader sequences of which they are a part, and particularly between the evaluation formats and the organizational features that distinguish different pedagogic activities, realized through teachers' prior questions.

Without in any way underestimating the extensive relevant (Lemke 1990; Nystrand and Gamoran 1991; Mercer 1995; Nassaji and Wells 2000; Nystrand et al. 2003; Alexander 2008; Mercer et al. 2009), it is clear that the explanations offered so far of the IRE model and of the teacher evaluative turns are based largely on functional categories, leaving unexplored how evaluations are generated through the organization of interaction itself. Although previous studies have provided generalized descriptions of the pedagogic functions of teacher evaluation, there is not yet a comprehensive account of how positive evaluations are constructed, and indeed what makes them positive and *recognizably* positive (i.e. to students). In line with some recent conversation on analytic work on teacher-led classroom discussions (Lee 2007, 2008; Hellermann 2003, 2005), our aim is to take this a stage further, giving close attention to the local contingencies of interaction in instruction sequences. Using Conversation Analysis as our methodological perspective, first we identify and explore the practices most frequently used by teachers to evaluate student answers positively. We then consider further the differential distribution of these positive evaluation formats as they occur in the larger instruction sequences, observing some systematic relationships. The analysis here shows that positive evaluation is a constitutive property of instruction activities, providing pupils with interpretive resources of the ongoing activity and, thus, enabling them to participate effectively in the interaction.

2. Data and methods

The data are video recordings made in an Italian primary school, of naturally occurring scheduled classes in a variety of subjects, in which teachers adopt a conventional 'chalk and talk' method, especially during the instruction phases of the lessons. They normally face the children, who are seated in parallel rows, and address the whole class or single students publicly. The corpus consists of approximately 80 hours and about 50 class periods in two third-year classes (ages 7–8). Two cameras were used in each classroom where the two classes took most of the lessons, one camera filming the teacher and the other the students. Participants included 50 pupils and their four teachers. Subject consent was obtained from all participants according to the Italian law n. 675/1996 '*Tutela delle*

persone e di altri soggetti rispetto al trattamento dei dati personali', in place at the time recordings were made (1999–2000), and which provided safeguards with regard to the treatment of personal data. Participants' names and any references to participants' private life have been anonymized. The recordings were transcribed according to the conventions widely adopted in Conversation Analysis (a glossary of these conventions is provided in the appendix), and translated into English.

Our analytical approach is Conversation Analysis (Schegloff 2007; Heritage and Clayman 2010; Sidnell and Stivers 2012), an empirical and inductive method relying on the systematic analysis of audio tapes and videotapes of naturally occurring interactions to identify and describe the practices which participants methodically use and to which they orient in their own social behaviour, in producing and understanding their own and others' conduct in everyday social interactions. In this study, we focus on excerpts during the early stages (first 30 minutes) of 10 lessons, in which extended teacher-led discussion takes place – often going over key aspects of previous lessons or reminding students of what has previously been covered. We identified 145 instances of questions asked by teachers in this phase of the class, the answers to which were positively evaluated by teachers.

3. Positive evaluation practices

In a sample of 200 teacher evaluations produced by four teachers in seven classes, 72.5% of students' answers were evaluated positively, and only 10% were evaluated negatively; in 17.5% of the cases identified, teachers treated the answer as not quite correct (inaccurate, inappropriate or incomplete). These percentages held across teachers and topics, suggesting that positive evaluations play a uniformly central role in formal primary instruction. In the 145 instances in our corpus in which teachers positively evaluate students' prior answers, we identified five principal construction formats,³ namely:

- explicit positive assessments,
- verbatim full repetitions of students' answers,
- embedded repetitions, or repetitions accompanied by other turn components,
- formulaic receipt particles,
- direct transition to the next Q–A sequence.

Therefore, instead of what is generally referred to in the IRE literature with the blanket term of (positive) 'evaluation' (Lee 2007), we find variations in the construction and delivery of positive receipts. We go on to demonstrate that teachers select from among these formats according to the larger design and pedagogic aims of the activity. Each of these five formats, and hence practices for evaluating students' answers positively, is outlined in the following sections.

3.1. Explicit positive evaluations

The clearest and most direct way in which teachers positively evaluate students' prior answers is to respond with an explicit evaluation terms such as '*bene*' (good) and '*bravo*' (good boy).

- (2) [PM:LT:5a:geometry] [T is demonstrating how angles work, by showing that, when changing direction, a body rotates and draws an angle on a plane surface. In the fragment, the teacher is eliciting a specific term that designates a type of line in geometry.]

- 180 01 T: quand' i' cambio direzio::ne:, fra l' altro formo? (.) ↓per terra
when I change direction by the way I form on the floor
 02 una bella linea,-
a beautiful line
 180 03 (.)
 04 St: s:pezzata.
broken
 185 05 (0.2)
 06 → T: ↓bravo.
good boy

190 The teacher's question in lines 1–2 is formed through a non-interrogative practice, known as 'designedly incomplete utterances' (Koshik 2002; Margutti 2010). It may be noted that in responding 'bravo' in line 6, the teacher evaluates the student's answer with what is literally a complimentary assessment of the student. Most explicit positive evaluations follow this pattern; in only two instances the teacher evaluated the answer itself, as illustrated in example 3 (in which the initial question and the student's reply are not shown).
 195

- (3) [PM:ET:2:natural sciences] [In line 1, T draws the class's attention to Luca's prior answer (not shown). The name of the student 'Luca' in lines 1 and 2 is thus used to refer to him, whereas in line 5, the name is used to address Luca, asking him to repeat his 'interesting' answer.]
 185 01 T: o::h ↑Lu::ca, (.) ' tenzi↑o::ne eh,=
oh Luca 'tention eh
 200 02 St: ah s::i.
ah yes
 03 → T: Luca stadicendo una cosa in[teressante=cos' hai detto
Luca is saying something interesting what did you say
 04 St: [eh
eh
 05 T: Luca ↓ripeti per favore.
Luca repeat please

In line 3, the teacher formulates an explicit positive assessment of Luca's answer, conveyed by the adjective 'interesting'.

3.2. Full – verbatim and freestanding – repetitions of students' answers

Teachers commonly endorse students' prior answers through some form of full or verbatim repetition of those answers, as illustrated in the following examples.

- 205 (4) [PM:FZ:12b:geography] [They are examining pictures and drawings representing views of towns, seaside resorts or country villages. A student is invited to name an element, either artificial or natural, from one of those pictures.]
 01 T: alo' ↑ne::lla figura numero ↑U::NO:::,
now in picture number one
 02 (0.6)
 03 T: MA:rcò: ↓ch' è mo:lto atte:nto::
 (NAME) **who's very attentive**
 04 (1.2)
 05 T: MI ↑SAI dire un elemento (.) umanizza:to
 to me can (you) say an element humanized
can you name for me a humanized element

6 P. Margutti and P. Drew

(three lines are omitted in which the teacher explains the meaning of the term 'humanized', as meaning 'artificial', 'not natural')

230 06 St: le: le case
the the houses
[DET. ART.] **houses**
07 → T: ↑LE ↓CA::SE::
[DET. ART.] **houses**

235 (5) [PM:LT:5:geometry] [From a lesson on angles. The teacher is eliciting from students the characterization of a line she has drawn.]

01 T: aperta o chiu::sa
open or closed
02 St: io lo [so
I know it
240 03 Ss: [chiu[::sa
closed
04 Ss: [chiu:sa
closed
245 05 → T: [chiu::sa::,
closed

(6) [PM:LT:2:natural sciences] [The teacher is eliciting answers to the question 'what are the components of soil'. Students answer in a round, remembering what they discovered the day before by observing a clod.]

240 01 T: dimm'
tell me
02 St: lo- hamu:s:
the [WRONG PRONUNCIATION OF THE WORD 'HUMUS']
250 03 T: sì./ ((to a child who spoke prior to line 1))
yes
04 (.)
05 T: eh? ((to child in line 2))
eh
06 St: hu[mu:s=
humus
07 St: [humus=
08 → T: =[humus?
09 (1.0)

(a few students after)

10 St: roccia madre.
rock [A TYPE OF]
11 St: roccia,
rock
245 12 → T: ROCCIA MA::DRE::
rock [A TYPE OF]

(a few students after)

255 13 T: Si [lvia
[NAME]
14 St [conchi::glie!
shells

15 (0.6) ((turn to look at the list of previously elicited answers on the blackboard))

16 → T conchi:glie, ((she writes it on the blackboard))
shells

(a few students after)

280 By reproducing the exact linguistic content of students' responses, teachers ratify their
 285 answers as 'expected' and, as such, 'correct'. Repeating another speaker's words is in
 290 some respects intrinsically affiliative (Pomerantz 1984, 66–67; Schegloff 1996, 78–81).
 However, there are characteristic features of the prosody of such affiliative repeats: very
 often the repetition is delivered with prosodic features that add emphasis to the student's
 production by means of sound stretching (as in ex. 4, line 7; ex. 5, line 5 and ex. 6, line
 12), raising the amplitude (ex. 4, line 7 and ex. 6, line 12) and up-and-down pitch shifts
 (ex. 4, line 7 and ex. 6, lines 8 and 16).

Hellermann (2003) noted a similar prosodic pattern in a sample of 177 instances of
 teacher lexical repeats of student answers (of which, 111 were repetitions in IRE sequen-
 ces) during 25 hours of discourse in a grade 12 physics class and in a grade 11 American
 history class. Hellermann (2003, 88–92) found that repetitions that are oriented to as posi-
 tive assessments display a specific *affiliative* prosodic pattern. This affiliative quality of
 teacher repetitions rests on four features, comparing the repetitions to the student
 responses: (1) the tempo of the repetition – its placement in relation to the student
 answers, synchrony and rhythm, (2) same pitch level as students' answers, (3) falling
 pitch contour and (4) duration of the repeat lengthened (in comparison with students' ver-
 sions) by sound stretching.

Our analysis of the prosodic packaging of teacher repetitions, based on Hellermann's
 four indicators, shows that affiliation and positive assessment in our data are managed
 through slightly different means, though closely related to the same indicators.⁴ First,
 the placement of these repeats is contiguous, and often in overlap with the answer, as
 for preferred types of actions. Second, the pitch level of the teacher's repeats is often
 higher than the surrounding talk, mainly because teachers raise the volume of voice, as
 in ex. 4, line 6 and ex. 6, line 12. Third, their intonation contour is always more dynamic
 than that of the answer they evaluate, with up–down pitch contour, as in ex. 4, line 7 and
 in ex. 6, line 16. However, the repeats in our data do not have a distinct falling intona-
 tion; rather, we find a slightly rising intonation, as in ex. 6, line 8, displaying the
 teacher's orientation to the position of each individual IRE sequence as one in a series.
 As we will show, these cases belong to a specific type of instruction sequence in which
 subsequent questions elicit responses in a list of same-set items (see also ex. 7 and end-
 note 7). Thus, the slightly rising intonation indicates this sense of an unfinished project.
 However, it is worth highlighting that there is a prosodic pattern shared by the majority
 of stand-alone verbatim repeats in our corpus through which the accented items of the
 repeated word are articulated and thereby emphasized. In ex. 6, the student answers
 have a tenser articulation in the second syllable of the word, whereas in the teacher's
 repeats, the emphasis withdraws in the first syllable. Combined with a distinctive higher
 pitch in the word initial syllables, this produces an intonation movement similar to the
 up–down contour reported by Gardner (1997) and Selting (1994) as associated with
 heightened involvement in assessments.⁵

Returning to the intrinsically positive (affiliative) character of verbatim repeats of a
 prior speaker's word(s), Schegloff (1996) notes that a verbatim repeat not only registers
 that prior response, but also *confirms* its correctness. Schegloff demonstrates that specifi-
 cally confirming the prior speaker's correctness (rather than simply agreeing with prior
 speaker) makes salient that the speaker (i.e. the one repeating the other's words) already
 knew the answer. The base component of the action that does 'confirming', therefore, is
 that *the speaker agrees with circumstances of which he has primary access*. It is signifi-
 cant that this same distribution of knowledge among speakers, whereby the speaker who
 repeats has primary access to the information that gets repeated, is present also in our

330 data. The questions whose answers are repeated in third position are, indeed, questions for which teachers know the answer in advance (also referred to as ‘test’ or ‘known-answer’ questions) and for which they have primary epistemic status. These aspects, together with a high density of repetitions and of repetition-involved practices in third position, contribute to the students’ understanding of this practice as doing positive evaluation.

335 Finally, it is worth noting that as well as repeating an answer as a means to confirm its correctness in the kind of freestanding repeats illustrated above, such repeats/confirmations may be reinforced by other accompanying conduct such as writing the answer on the blackboard, nodding and other gestural activities, and moving immediately on to a next question. For example, in extract 7, the teacher follows a repetition by declaring that
340 the answer will be written on the blackboard (line 6).

(7) [PM:LL:1a:history] [T asks each student in turn to name something needed by pre-historic peoples. In line 1, T names student, who is thereby selected to answer next]

01 T: all::o::ra.(.) Desirée;
now Desirée

02 St: io=
me

345 03 St: =i:::
[FIRST VOWEL SOUND OF THE FIRST PERS. PRONOUN 'IO']

04 (Des)St: oggetti per cacciare
objects for hunting
hunting tools

05 (0.6)

06 → T: oggetti per caccia:re;⁶
hunting tools let's write hunting tools

And having repeated the student’s (Cristina’s) answer to ‘how many times’ in extract 8, the teacher moves on to ask the same student about another aspect of the topic of her questions.

(8) [PM:LT:5a:geometry] [Giovanni has been directed by T to walk along a particular line and change direction twice; T now asks Cristina questions about the angles involved]

350 01 T: Cristina seco:ndo te quante volte ha::: m'
Cristina in your opinion how many times did he m'

02 cambiato (.) direzione Giovanni
change direction Giovanni

(13 lines omitted; other students attempt to answer, T accounts for selecting Cristina)

04 St: due volte
two times
twice

05 → T: due volte.<quando Cristina
two times when Cristina
twice when⁷ Cristina

Following her verbatim repeat in line 5, the teacher next asks Cristina about something else, about *when* Giovanni had changed direction (in order to establish how far in each direction Giovanni went before changing direction) – thereby consolidating the sense that ‘twice’ was the correct answer to *how many times?* Thus, displaying the answer as

‘correct’ is achieved partly through the repeated answer being treated as having been part of a progression towards something more, a step in a sequence.⁸ In cases such as this in extract 8, where the verbatim repeat is followed by asking a next question, the prosody of the repeat is different from the stand-alone repeats illustrated in extracts 4–6, which are more dynamic and have a characteristic ‘hyperarticulation’ (Ogden 2006, 1762). By contrast, the quality of the repeat *due volte* in line 5 as assessing is conveyed through a distinct falling intonation and by a tenser articulation of the initial syllable of the word ‘*due*’. Furthermore, by continuing on to the next question right away in a rush-through (Schegloff 1982, 76), the teacher conveys that the answer is ‘correct’ not only per se, for its truth value, but also because it is exactly the right stepping stone to move ahead in the larger sequence.

3.3. Embedded and accompanied repetitions

Teachers’ repetitions of students’ answers may frequently be embedded in some expanded version of the answer.

(9) [PM:LT:5a:geometry] [Following a demonstration about angles, T is asking students to comment on what they have just seen.]

01 T: all’ inizio il braccio dove guardava
at the beginning the arm where did it point at
 02 (0.4)
 03 St: la fine: [stra
the window
 04 → T: [verso la finestra sempre.
at the window too

The student’s answer in line 3 is a noun phrase, which the teacher repeats in the context of a fuller syntactic form (clause). Whereas in verbatim repetitions teachers accomplish positive judgements mainly through prosodic variations, here they achieve this by means of syntax. By including the repetition of the answer as part of a larger unit, the teacher emphasizes his/her primary access to the information elicited with the question.

In other cases, the repetition may be followed by or combined with formulaic receipt tokens, as in ex. 10.

(10) [PM:LT:7:geometry] [T is asking Ss for their observations about cardboard models of angles and what each angle is called]

01 T: come? si chiama l’ angolo [più piccolo [dell’ angolo retto
 what is called the angle more small than the angle right
what is it called the angle smaller than the right angle
 02 St:
 410 [‘cu::to
 ‘cute
 03 Ss:
 [acu:to
acute
 04 St:
 acu::to
acute
 05 (3.0)/((students talking))
 06 → T: l’ A:NGOLO acu:to. va bene.
 the angle acute va bene
acute angle alright

Through such expanded repetitions, teachers do more than just acknowledge the correctness of the answer. For instance, the explicit positive assessment ‘*va bene*’ (see Section 3.1) in ex. 10 underlines its additional sequence-closing function (Schegloff 2007, 118).⁹

425

3.4. Particles

The third construction format teachers may use to evaluate prior answers positively consists of particles such as *mm* or *oh* without any accompaniment, as in these two examples.

(11) [PM:FZ:12b:geography] [T has asked about the reasons for small villages becoming towns.]

- 430 01 St: eh- alora. (.) pri:mo perché (0.4) eh::mh face:n:do le::
eh- so first because ehmh making the
(DEF.ART.PL.FEM.)
- 02 mh la ca:se:, mettono anche più negozi così le persone
mh the houses (THEY) put also more shops so the people
(ART.DEF.SING.FEM.)
- 435 03 ↓ possono anche lavorare di più:
can also work more
- 04 (.)
- 05 → T: ↑mm:::

440

(12) [PM:FZ:12b:geography] [About those features of land that are favourable for urban settlements; T addresses the question to the whole class.]

- 01 T: è più comodo costruire lontano dai fiumi? o vicino
(IT) is more convenient to build far from rivers or close
is it more convenient to build far from rivers or close
- 02 ai fiu[mi
to rivers
- 435 03 Ss: [vi[ci::no:
close
- 04 Ss: [vici::no:::
close
- 05 (0.4)
- 445 06 → T: oh:::
oh
- 07 (0.2)
- 08 T: LE STRA::DE è più facile costruirle in monta:gna?
streets is it easier to build them on the mountains
- 09 or in pianura
or on the plain

Whilst the particles in these third-turn positions have no precise lexical ‘meaning’, nonetheless they convey the teacher’s endorsement of the prior answers. The evidence for this is partly that they are treated as accepting the answer as correct; in no case does the teacher follow such particles by initiating repair on the prior answer. Moreover, there is evidence from research in a variety of other interactional settings that they work to indicate that the speaker has been informed by the other (see Heritage 1984 on *oh* as receipting question-elicited informings; see also Schegloff 2007 on this type of *oh* as proposing sequence closure). Notice that in line 6 of extract 12, the stretching of the sound and its final intonation contour register the answer as long-awaited information, endorsing it as correct and adding a confirmation nuance of meaning to the receipt.

470 **Q19** Likewise, *mm*, in the position of third-turn receipts of answers in IRE sequences, as in line 5 of fragment 11, works as an evaluation token. Its up-down intonation contour ($\uparrow mm:::$), resulting from the initial voice higher pitch and stressed articulation of the sound, followed by a more relaxed and stretched vocalization, is similar to assessment-like *mms*:

475 an *Mm* with rise-falling contour was found to be an expression of heightened involvement, showing affinities with assessment tokens. It can be seen as a weak version of items such as Wow, Great, or Amazing. This up-down intonation contour is characteristic of many assessments. (Gardner 1997, 147)

480 Owing to these prosodic features, the receipt-token *mm* in ex. 11 assesses the answer positively, but the flat final intonation gives it the characterization as a weak positive assessment. By contrast, the stretching of the sound and the final intonation contour of *oh* in extract 12 (line 6) endorses the answer as totally correct, the positive evaluation being highlighted by the particle's role as closing-relevant.

3.5. Direct transition to the next Q–A sequence

485 The final practice used to evaluate answers positively consists of simply moving on to ask a next question, without having made any evaluation, explicit or implicit – indeed, without having acknowledged the prior answer, nor repeat the students' answers, nor even utter a particle in acknowledgement of the prior answer. This is the most elliptical form of evaluation, the affirmative work relying on the very *absence* of any overt evaluation. The arrowed lines in the following examples show teachers asking next questions.

490 (13) [PM:LT:5:geometry] [for background information, see ex. 5]

01 St1: i::o! :! spezzata!
me broken

02 St2: [spezzata!
broken

03 St3: 'zata!
'ken

04 → T: aperta o chiu::sa.
open or closed

(14) [PM:FZ:12b:geography] [for background information, see ex. 12]

01 T: è più comodo costruire in pianu:ra? - (.) o:- in collina
is it more convenient to build on plains or on hills

02 Sts: pia[nu::ra
plains

03 Sts: [pianu::ra
plains

04 → T: è più comodo costruire lontano dai fiumi? o vicino ai
is it more convenient to build far from rivers or close to

05 fiumi
rivers

495

In neither case does the teacher make any overt assessment of the prior answer (given in lines 1–3 in each example). Notice that whereas the teacher in example 1 also did not provide an overt assessment, that was understood by the students to indicate that the initial answer (*water*, line 4) was incorrect; moreover, the teacher subsequently re-asked the same question (line 7). Hence, the absence of a third-turn receipt is *not sufficient* to

515 convey a positive evaluation; it is the movement to a next (different) question that indicates to the students that the prior answer was correct, by being sufficient in order to progress to the next question.

4. Positive evaluation practices and pedagogic activities¹⁰

520 In the previous section, we have reported the formats for teacher positive evaluations broadly speaking in terms of a continuum from those formats in which students' answers are evaluated more explicitly to those that are most implicit, indirect or elliptical. Their differential frequency of occurrence is summarized in Table 1, from which it is clear that repetitions of one form or another (i.e. whether simple verbatim repetitions or embedded repetitions) are the most commonly used method of positively evaluating students' prior answers. The next most frequent practice is the one that precisely does *not* (overtly) evaluate the prior answer, but instead simply moves on to ask a next question. Explicitly positive evaluation formats are rather infrequently used, whilst the two examples of the use of particles shown above are the only two occurring in our sample of 145 positive evaluations (there are further instances in our larger data corpus.¹¹)

530 According to the IRE model, it is sufficient for a teacher to select from among the available positive evaluation formats – *any one* from among them – in order to fulfil the requirements of the IRE sequence structure. No further account is provided than that teachers evaluate the correctness or otherwise of prior answers. Thus, little is known from the existing literature about any possible linkage between each (positive) evaluation format and the specific pedagogic activity types in which it occurs.¹² Therefore, for instance, although there is a literature on how teachers (or caretakers) differentiate their verbal behaviour to convey negative or positive evaluation (Tarplee 1996; Hellerman 2003), or how they manage to progress the interaction when students fail to answer (Drew 1981; Q20 McHoul 1990; Macbeth 2004; Lee 2007), no previous research has shown that the format of positive evaluations is associated with the specific type of activity thus enacted.

540 Our investigation of the differential distribution of these positive evaluation formats in different pedagogic activities reveals that the format of the third evaluative turn is a constitutive property of the design and construction of the broader pedagogic activity, not only because it accomplishes the objective of ratifying the answer as correct, but particularly because it provides students with interpretive resources for understanding more broadly the type of activity being enacted and teachers' pedagogic goals. We go on to show that free-standing teachers' verbatim (full) repetitions of students' prior answers are systematically associated with recursive sequences following the same questioning procedure, in which the pedagogic activity is to test whether students are able to follow the procedure accurately enough to arrive at 'right' answers – in other words, accumulating similar (kinds of) answers to similar (kinds of) questions. By contrast, the other formats that we have

550
550 Table 1. Distribution of third-turn positive receipts of students' answers (total 145).

Third-turn format types (instances)	Percentage
Full repetitions (51)	35.20%
Embedded or accompanied repetitions (54)	37.24%
Direct transition to next question (24)	16.55%
Assessment terms (8)	5.51%
Particles (2)	1.37%
Miscellaneous (6)	4.13%

identified may be used, individually or in combination, in what Levinson describes as a more Socratic method of instruction (Levinson 1992, 90), in which teachers develop a line of reasoning or argumentation through a series of questions-and-answers, each of which stands as a building block supporting the next stage in the progression of the instruction sequence. In this second pedagogic activity, each question (and the information thus elicited) has a different weight and role in the progression of the instruction sequence.

4.1. Pedagogic activity I: questions designed to be answered by following the same procedure as was used previously to answer correctly

In teachers' evaluations formatted as freestanding verbatim repetitions, the exact lexical replication of the answer is the *only* compositional unit of the turn before the next question is asked.¹³ Example 15 is a case in point. The teacher is engaging the class in observations of pictures representing views of different human settlements in various surroundings, some of which are more natural than others. She asks the students to answer in succession to what is essentially the same question – to name either an artificial or a natural element in one of the pictures selected. The aim of the activity is to build/distinguish the notions of artificiality vs. naturalness, and accordingly to verify whether students can classify items correctly.

(15) [PM:FZ:12b:geography]

620

In line 7, Marco's answer is acknowledged with a lexical repetition, delivered (as we have seen above) with dynamic intonation contour (Ogden, 2006), displaying the positive affiliative/positive quality of the repetition. However, in addition to its dynamic intonation movement, what makes the repetition an acceptance of the answer is also the manner in which the talk progresses *after the repetition*. Hence, three main features are associated with the positive character of this evaluation: (1) the repetition replicates the answer verbatim but is phonetically more dynamic; (2) after the repetition, the teacher asks a next question without adding any other component; and (3) the question which follows (lines 9 and 15) has the *same format* as the preceding one (line 5) (the teacher interrupts her first attempt in line 5 when she discovers a problem that another student is having).

625

630

Thus, if we look *beyond the single IRE sequence* and broaden our analytical focus to include the serial organization of questions in this sequence, each question requires students to follow *the same procedure* as they did to arrive at a previous 'right' answer. Therefore, ex. 15 consists of a series of same-format questions that further the pedagogic activity of testing whether students have understood the procedure by which a 'right' answer can be arrived at. In this context, the acceptance of the answer is heard as the result of both the repetition format *and* the production of the next same-format question in a series. It is, therefore, only when the teacher moves to the next stage in the instruction sequence that the previous answer is understood as having fulfilled the prior question's requirements, so that it is now possible to progress.

635

640

In such sequences, teachers design each next question (lines 15 and 27) according to the same format or formula as they used for the first (line 5); by producing a series of same-format questioning turns, the teacher creates a self-replicating and recurrent instruction context. Starting from the second questioning turn, it soon becomes clear to students that they are to re-apply the same procedure each time. Evaluating an answer as

645

645

appropriate in this activity context is not only a matter of assessing its intrinsic or objective ‘truth value’, but also a matter of assessing its appropriateness for the requirements of the instruction procedure thus enacted.

As Lee has argued, ‘questioning sequences are designed not only to elicit answers from students but also to build resources for them’ (Lee 2008, 258). The teacher’s selection of the format with which to evaluate a prior answer, and hence that answers to same-format questions are ratified by same-format evaluations, contributes to the instruction potential of instruction sequences. As we will see in the next section, this observation is supported by the evidence that teachers adopt different constructional choices in evaluating student answers in the context of activities where responses to differently formatted questions are ratified by quite different evaluation formats.

4.2. Pedagogic activity II: questions developing a line of reasoning

In Section 4.1, we have seen that there is a systematic relation between the construction format of freestanding verbatim repeat evaluations and the specific kind of pedagogic activity that is being managed through the teacher’s prior question (following a procedure to arrive at the right answer). Here, we consider a contrasting pedagogic activity pursued through sequences in which each Q–A pair – together with the teacher’s evaluation – puts in place a building block in the progression towards an end point in which the teacher will conclude through having demonstrated some point, argument or concept. The pedagogic activity is thus different from that described in the previous section; this difference is reflected in different designs of each question in the series, and particularly in the formats with which teachers evaluate students’ answers to these ‘building block’ questions – they are *not* constructed as freestanding verbatim repeats, but instead take other construction formats.

Extract 16 is from a geometry lesson where a simple demonstration of angles has just taken place, consisting in Giovanni pacing the room according to the teacher’s instructions. The teacher has instructed him to keep his right arm raised parallel to the floor, and to turn right or left a couple of times. Starting from the door, Giovanni takes three steps ahead to reach the teacher’s desk; then he turns left and moves a few steps in the direction of the bottom of the room. Finally, he turns a second time, to the right, and takes eight more steps, ending by the window. The aim of this is to show that, each time Giovanni changes direction, his body and arm rotate, drawing an angle in the air. The excerpt begins with the teacher asking Cristina a few questions about what has just occurred.

710 Notice that the form and character of each of the questions in lines 1, 17, 26 and 29 (single-
 arrowed lines indicate teacher questions) are different. In line 1, the teacher asks 'how many times did he change...?'; in line 17, she asks 'when (did he change)?' and in line 26, she asks 'what did he do..?' Parenthetically, we already begin to see the contrast in terms of the pedagogic activity illustrated in ex. 15, in which the teacher uses the *same format* when she asks 'Can you name for me (a natural/artificial element)?', but to different students in a round – whereas here she is asking *different-format* questions of the same student. Furthermore, it is worth recalling that in the preceding activity, the same-format series of questions is designed to elicit information organized as a list of items (artificial or natural elements) belonging to a specific set (urban human settlements) – this being designed to direct them in grasping the meaning of the terms 'natural' and 'artificial' by comparing the items elicited in each of the two sets. By contrast, the activity illustrated in extract 16 involves developing a line of reasoning, building towards a final point, the concept of 'angle'. In this case, the instruction sequence consists of a series of different-format questions, each having a different role and weight in the larger sequence. Like 'stepping stones', these questions are designed to lead students to a concluding message or point. The different function played by each question in this 'argumentative' type of pedagogic activity is evidenced by the *different format* of the questions and, consequently, by the different practices used to confirm the answer as correct.

725 As it happens, after the first 'correct' answer (line 16), Cristina fails to answer the question in line 17, so the teacher asks the question several times (lines omitted). Having not received a satisfactory answer, the teacher takes a different route. Rather than asking Cristina to say 'when' did Giovanni changed direction, as she did in line 17, the teacher asks instead about each turning point. When the teacher asks the question in line 26, she physically repeats the demonstration. The third question in the fragment (line 29) differs from both the two previous ones: it elicits a response through a non-interrogative format, and is deployed in third position, thereby evaluating the students' answers (lines 27 and 28) with a direct transition to the next Q–A sequence (Section 3.5).¹⁴ This practice marks the answer (to which the question responds) as providing information elicited *in the service of a superordinate purpose*. Finally, when the students fail to answer – the 0.8 second pause in line 30 – the teacher answers it herself. So here in ex. 16, each question has a different format; the teacher's aim is to build towards a particular conclusion through concatenated steps requiring a *different* procedure to be followed to answer correctly,

730

735

740

each question also being designed to handle *specific local contingencies* (such as, for instance, those in which a student fails to answer).

However, the key point to highlight is that the teacher constructs her evaluations through different formats (double-arrowed lines indicate the position of evaluations). In line 17, she evaluates the correctness of Cristina's answer by first repeating that answer ('twice') and then adds her next question ('when Cristina?'). Therefore, instead of stand-alone verbatim repeats (the form used to evaluate students' answers in the previous pedagogic activity), here the teacher constructs a two-unit turn, where, after the repeat, the teacher moves immediately to a next and different question, progressing the sequence further (Section 3.2). Evidence that the turn is specifically designed in that way, to do that pedagogic work, and that stand-alone lexical repetition is *not* the appropriate evaluation practice here is the teacher's rush-through (indicated with the symbol <, line 17), pulling together the lexical repetition of the answer and the subsequent question as two elements or construction units of the same turn to build one utterance 'unit'.

So now we see that, in sequences having this kind of 'progressive' instructional approach in which teachers embark on a step-by-step progression towards a conclusion, each question is designed differently – and most importantly, the evaluations are constructed in ways *other than* verbatim stand-alone repeats. Moreover, each evaluation format in this excerpt is different from the other; so, different evaluation formats are used according to the interactional contingencies of the particular Q–A sequence involved.

If we look ahead to the point at which the teacher is now getting to the concept that she embarked on and was progressing towards in ex. 16 – which is the concept of an angle in geometry – we can see that here too she uses a variety of question forms. Again, significantly she also constructs her evaluations through different formats.

830 Her first evaluation in line 3 might seem to be an instance of the format used in the other pedagogic activity, a verbatim repeat of the students' answer; but it is not. This is only a partial repeat of the student's answer, 'rotazio:ne', evaluating this response positively but indirectly through completing her own turn – adding 'zio:ne' to her incomplete 'ro:ta:?' Furthermore, this partial repetition does not display the features that characterize the hyperarticulation found in verbatim stand-alone repetitions, such as the up-down intonation contour. The stretching of the vowel sound and the falling intonation contour are rather linked to the teacher completion of her own turn.

835 Then, the teacher asks the question which brings them to the key and concluding point of this phase of the lesson, asking them 'what do I form?' (lines 17 and 22) – to which they answer in unison ('angles', lines 24 and 25). The question has a rather elaborated delivery (arrowed lines). Having reached its first completion in line 9, the teacher does not give permission to answer to the students who bid for it (lines 10 and 11), being the question addressed to Cristina. In line 12, the teacher produces an increment to the question, which is followed by other bids to answer (lines 13 and 14); but Cristina still does not answer. In line 15, the teacher re-asks the question with the interjection 'eh', again without getting any response. At this point, she re-reformulates the question ('↑co:sa

840

faccio io = ↑*co:sa fo:rmo'*), eliciting more bids to answer (lines 18 and 20).
 845 Only in line 22, does the teacher give students permission to answer, which they do in unison. As the delivery of the question is the result of complex processing, the evaluation is equally elaborated. The teacher's positive evaluation of this answer starts in line 26, in the form of a complex turn construction consisting of [repeat] + [formulaic receipt particle] + [embedded repetition] + [formulaic receipt particle] + [next question] ([an angle] + [alright] + [I form an angle] + [okay] + [an angle what is it – it is formed – it is due to the change of]). By holding back other students who are competing to answer the question, and providing subsequent reformulations of the questions, the teacher highlights how the information thus elicited has a special status in the activity. Thus, once the answer is provided, the very complex format of the positive evaluation is designed to parallel this 'drawing answers together' to a conclusion. Finally, in this excerpt, this multi-unit evaluation turn ends in line 28, with a designedly self-interrupted utterance, whose answer is constructed as an [embedded repeat] + [next question] (line 32). So again, an answer is evaluated with a format constructed to fit a different question form.

860 The key point here is that the teacher does *not* use the stand-alone verbatim repeat used when engaged in the 'procedural' pedagogic activity outlined in the previous section. By choosing different formats to evaluate answers positively, the teacher builds a different pedagogic activity sequence in which students are led along a line of reasoning towards a concluding point or message.

865 5. Conclusions

We have focused on positive evaluations in classroom instruction organized as series of IRE sequences, in which teachers publicly address the whole class or single students publicly. In our data, other types of teachers' assessments – negative or other non-positive assessments – are very much less frequent, as documented above.

870 We identified five main formats through which teachers assess student's prior answers positively, of which repetitions of one form or another are the most common format. The analysis shows how each format is variously designed in terms of lexis, syntax, phonetics and other aspects of turn construction and sequential position – all working affiliatively to confirm the correctness of the answer. Other features such as the ways in which talk progresses to the next question also play a role in evaluating answers positively. We have demonstrated that participants themselves orient to these practices as accomplishing positive evaluation.

885 Our other principal finding is that teachers do not employ these formats/practices randomly; rather, they are systematically selected according to teachers' engagement in one of two specific pedagogic activities. In both of these pedagogic activities, questions are asked in a series; but each activity has a different internal organization, achieving a different instruction project. In one case, with concatenated *same-format questions*, teachers design an activity that aims to instruct students how to follow a procedure to arrive at the 'right' answer. In the other, characterized by a series of *differently formatted questions*, they develop a line of reasoning that leads to a final point. We have shown that there is a systematic association between these two instructing methods and the positive evaluation practices selected within each. In the former type, teachers use only freestanding verbatim repetition; in the latter, they construct their positive evaluation through different formats. By differentiating their evaluation techniques to reflect the overarching instruction method, teachers provide an in-built mechanism for students to recognize the activity in hand.

Finally, our study provides an explanation for the resilience of evaluative third evaluative turns in the everyday teaching practice, suggesting that this activity can be considered – and certainly *is* considered by both teachers and students – as manifesting in a very real way the success or otherwise of the ongoing teaching and learning process. It is appropriate, therefore, that we should better understand the ‘work’ managed through evaluating answers, how teachers accomplish that ‘work’ and how the complexities of evaluating are related to the pedagogical aims of teachers in the classroom.

Q23

Notes

1. ‘We define uptake as occurring when one conversant, for example, a teacher, asks someone else, for example, a student, about something the other person said previously (Collins 1982)’ in Nystrand et al. (2003, 145).
2. With ‘eh’ is rendered in Italian an interjection that accomplishes many functions (Laurentia Dascalu and Vanelli 1996).
3. There was a small group of miscellaneous formats, including reformulations, which were so infrequent as not to warrant attention in this report.
4. Reasons for the different prosodic packaging of teacher repetitions to convey positive assessment might be associated to language-specific uses of prosody or, also, to the organization of the whole domain of practices involved in conveying positive/negative evaluation of students’ answer. With regard to the latter, in our data, lexical repetition or repetition-involved practices are used to provide a *routine positive evaluation* of the answer, whereas other non-routine treatments of the answers that convey a milder affiliation or judgements of the answer as wrong, incomplete, inappropriate or vague employ other resources than repetition. Hellermann’s study (2003) is different because it compares the prosodic and phonetic realization of repetitions used to do positive evaluations with those conveying judgements other than positive. It would be also wrong to compare our findings to those in Hellermann’s paper because the two studies have different purposes: the import of prosody in the IRE exchange in Hellermann’s vs. the organization of the domain of positive evaluation in IRE-shaped instruction sequences in our work. Another variable that might be responsible for the differences of our findings in comparison to Hellermann’s is the different ages of the students who were recorded.
5. It is worth adding that these observations on the phonetics of teacher positive repeats are also in line with findings from a study by Ogden (2006) on the phonetic resources used to convey agreement/disagreement in ordinary conversation, where the author provides evidence for the existence of a distinct phonetic pattern for agreement in second assessments.
6. In this example the teacher repeats the answer with slightly rising intonation (as indicated by the symbol $\dot{\text{;}}$). In Italian, not differently from English and other languages, repeating the answer with rising intonation might be heard as prompting self-correction. However, attention has to be drawn here to two contextual properties of the interaction, which suggest to exclude this function. First, the fact that the teacher is eliciting responses in a round (see background information provided); the rising intonation indicates suspension and characterizes the answer as one in a series, with other answers to come. Second, and in support of that, it is worth noticing that the same intonation contour is consistently used also to deliver the second unit of the turn, in which the teacher further ratifies the correctness of the answer by announcing that it will be written on the blackboard.
7. The interrogative adverb ‘when’ refers back to prior question in line 1; therefore, here, ‘when’ is elliptical for ‘when he did he change direction?’.
8. See also McHoul who observes that whilst there is no explicit evaluation, ‘(the) answer is nevertheless shown to be acceptable by virtue of the teacher doing a thematic continuation of it’, in McHoul (1990, 357).
9. To our knowledge, there are no studies available on the use of ‘*va bene*’ in Italian interaction, on which to ground a characterization of this use. However, from a very cursory inspection of a collection of ordinary interaction in Italian telephone calls, we register a very high density of ‘*va bene*’ in the closing of the calls, especially when speakers make final arrangements.
10. We use here the terms ‘evaluation format’ and ‘evaluation practice’ as referring to the same type of analytical object, to include also ‘zero-evaluation’ cases, in which the teacher does not

Q25

produce any explicit (lexical) or implicit (phonetic) evaluation-dedicated turn or component, but moves to next question. Thus, although otherwise specified, here we consider these two terms interchangeable.

- 950 11. It is worth noting that a study by Koole (2012) based on a corpus of Dutch dyadic teacher–students interaction (ages 12–13) shows very different proportions. In that study, overt evaluations outnumber the other formats by covering the 57% of the 170 teacher evaluations of the sample. We do not have enough evidence to suggest that these different findings might indicate a cultural variation in the distribution of overt evaluation of student answers; especially if we consider that the Italian and Dutch contexts presents also variations concerning variables other than cultural background, such as the setting (dyadic vs. teacher/whole-class) and the students' age (8/7 vs. 12/13). In our corpus, we did not register any individual variation among the four teachers on this respect. Therefore, we can affirm that this is a commonly used practice.
- 955 12. Two studies in particular – Nassaji and Wells (2000) and Nystrand et al. (2003) – have addressed the relationship between the function of teacher third turn in IRE sequences and type of classroom discourse. As argued by Lee (2007), however, in that study, the function of the teacher third turn is defined by means of a predetermined and abstract coding system, whereby a fixed and limited repertoire of possible actions are identified (for instance, evaluation, justification, clarification, etc.) and related to a specific teacher role (primary knower vs. not-knowing interlocutor), types of questions (known-answer vs. genuine or exploratory questions) and classroom discourse modes (monologic vs. dialogic).
- 960 13. Note that examples 7 and 8 are variations of the full, verbatim and freestanding format through which teachers may deliver positive evaluations. In those cases, *non-vocal* conduct accompanied the (verbal) repetition – which, therefore, is otherwise freestanding (i.e. verbally).
- 965 14. Here, it is important to understand that 'girato' (Cristina's answer in line 28) is a verb (past participle of the verb 'to turn'), whilst the teacher's question in line 29 concerns the action 'giro' (noun, in English 'a turn') that has therefore been performed.

Appendix

In [Table A1](#), we describe the transcription symbols used in the extracts, symbols devised by Jefferson (2004).

Table A1. Transcript conventions.

Symbols	Description
(.)	Indicates a gap of less than one-tenth of a second
(0.7)	Pauses timed in tenths of a second
[Start of overlapping talk across adjacent lines
=	No discernible interval between turns or prior words
.	Falling intonation
,	Continuing intonation
ˆ	Slightly rising intonation
?	Rising intonation (not necessarily a question)
.hhh	In-breath
hhh.	Out-breath
wohrd heh	Audible aspirations within words, including in laughter
°word°	Talk quieter than surrounding talk
WORD	Talk much louder than surrounding talk
Word	Vocal emphasis
↑word↓	Marked variations in pitch in the following word/syllable
(word)	The transcriber's 'best hearing' of what is said, when unclear or uncertain
<	Indicate that the following talk sounds like it starts with a rush
<word>	Talk much slower than surrounding talk
>word<	Talk much faster than surrounding talk
((.....))	Text in italic in double parenthesis represent an effort to describe other forms conduct
→	Indicates lines of particular interest
