e-mail: moskovkin@bsu.edu.ru

**Abstract:** The article presents a matrix of pairwise correlations for 26 regions of the Central and North-West Federal Districts of Russia between ten scientific-innovation and macroeconomic indicators comprising a number of objects of the innovation infrastructure according to two databases, a number of universities, university potential which had been calculated based on Webometric rankings of universities, a number of Scopus-publications in universities of the regions during the year 2015, and, in general, the Gross Regional Product, a number of population, the Gross Regional Product per capita, population density.

In all cases there were obtained high values of Pearson's Correlation Coefficient. It has been concluded that a high level of scientific-innovation development of regions is based on a high degree of social-economic development of their urbanized territories that is the Gross Regional Product and a number of population, rather than the reverse.

**Key words:** Correlation relationship, Scientific-innovation indicators, macroeconomic indicators, Scopus-publications, Gross Regional Product, population, Webometrics, Russian regions, Central Federal District, North-West Federal District, Cross correlation matrix, regional innovation infrastructure.

### INTRODUCTION

Dynamics of the Russian regional innovation infrastructure objects was studied in the works [1-4], their correlation relation with the Gross Regional Product (GRP) – in the work [5], the correlation relation between regional macroeconomic indicators (the Gross Regional Product, a number of population) and a number of universities according to the Russian regions was studied in the works [6,7], the comparative analysis of publication activity of the Russian leading universities conducted on the basis of Web of Science and Scopus databases was carried out in the work [8].

Together with the Gross Regional Product and a number of population there will be used in this work the Gross Regional Product per capita and population density as macroeconomic indicators, and a number of objects of regional innovation infrastructure according to two databases [9,10], a number of universities in the Russian regions according to Webometrics database, the total and current (2015) number of Scopus-publications according to universities of regions and an indicator of regional university potential calculated specially according to Webometrics database as scientific-innovative indicators. It should be noted that the Federal State Statistics Service (ROSSTAT) data on the macroeconomic indicators were taken for 2013 in the works [5-7], and in this work we will operate the data for 2014.

### METHODOLOGY

From the point of view of empiric basis and preparation of initial data on all indicators, we will rely on the abovementioned works [1-8], the databases according to objects of regional innovation infrastructure [9,10], the database according to macroeconomic indicators of the

Federal State Statistics Service (ROSSTAT), the database according to Webometrics rankings of universities and Scopus database according to university publication activity. It is obvious that the regional university potential may be calculated by various ways. To a first approximation, it may be the total number of universities in a region ( $N_{um2015}$ ) calculated according to Webometrics database [6,7]. To a second, stricter, approximation, we will propose to take into account the national Webometric rankings of universities in this work. Let us set the national (country) ranking (rank, place of a university in the national Webometric ranking) of an  $i$  university in a  $j$  region by  $R_{ij}$ . For each  $j$  it is taken its own numeration from  $i=1$  to  $i=n_j$  - number of universities in the  $j$  region. In order to transform  $R_{ij}$  values into a unit interval we will use a standard rate setting procedure

$$r_{ij} = \frac{\max_{ij} R_{ij} - R_{ij}}{\max_{ij} R_{ij} - \min_{ij} R_{ij}} \quad (1)$$

Then the regional university potential  $I_j$  can be calculated based on the formula (1)

$$I_j = \sum_{i=1}^{n_j} r_{ij} = \sum_{i=1}^{n_j} \left( \frac{\max_{ij} R_{ij} - R_{ij}}{\max_{ij} R_{ij} - \min_{ij} R_{ij}} \right) \quad (2)$$

We will take the data according to Webometric rankings of universities for July 2015 [6,7].

In this case,  $\max_{ij} R_{ij} = 1482$ ,  $\min_{ij} R_{ij} = 1$ , then we will

re-write the formula (2) as follows:

$$I_j = \sum_{i=1}^{n_j} \left( \frac{1482 - R_{ij}}{1481} \right), \quad (3)$$

where  $j = \overline{1, 27}$

Data according to two innovation and four macroeconomic indicators was taken as of the end of 2014. Data on Scopus-publication activity of universities was taken from Scopus database within the period from 5 to 13 October, 2016 (there was taken the cumulative data and data for 2015).

27 regions of the bordering Central and North-West Federal Districts were taken as the Russian Regions. The last region (the Nenets Autonomous District) we determined as an statistical outlier and excluded it from the further regression-correlation analysis.

Upon the preparation and calculation of all initial data, we conducted the regression-correlation analysis using the standard Microsoft Excel opportunities. Finally, we calculated a cross-correlation

matrix for ten macroeconomic and scientific-innovation indicators of regions of the Federal Districts under consideration.

**RESULTS AND DISCUSSION**

The distribution of Scopus-publications according to universities of regions of the Central and North-West Federal Districts of Russia is shown in Table 1, and all initial data for the regression-correlation analysis is shown in Table 2 in which  $N_{in}^1$  and  $N_{in}^2$  is a number of objects of the regional innovation infrastructure, respectively, according to the first [9] and second [10] database of these objects,  $N_{scj}$  is the total number of Scopus-publications in universities of a region,  $N_{scj_{2015}}$  is a number of Scopus-publications in universities of a region during 2015 (the value of both indicators is taken from Table 1). In Table 1 the first 17 regions relate to the Central Federal District and the rest 10 regions relate to the bordering North-West Federal District.

From Table 1 we see that the apparent leaders in Scopus-publication activity are Moscow and St. Petersburg, which have respectively 67 and 28 universities, in turn, correspondingly, 13542 and 6218 Scopus publications in 2015.

In the further calculations the data for the Nenets Autonomous District (region No. 27) was excluded from the analysis, as there was observed the abnormally high Gross Regional Product per capita for it due to the high Gross Domestic Product (oil-and-gas-bearing region) and very low number of population.

The matrix of pairwise correlations for ten macroeconomic and scientific-innovation indicators for 26 regions of the Central and North-West Federal Districts of Russia is shown in Table 3.

**Table 3**

$N_{in, 2014}^1$	0.9653	0.9879	0.9933	0.8794	0.9852	0.9843	1			
$N_{in, 2014}^2$	0.9647	0.9908	0.9982	0.8842	0.9856	0.9846	0.9941	1		
$P_j$ , Population (thous. people), 2014	0.9888	0.9865	0.9785	0.8716	0.9922	0.9927	0.9834	0.9742	1	
$\rho_j$ , Population density, people /km <sup>2</sup>	0.9682	0.9258	0.8776	0.8141	0.9346	0.9381	0.8757	0.8710	0.9372	1

Table 3 contains the value of Pearson’s Correlation Coefficient ( R ). As we see from this table, there was throughout obtained very high values of the Correlation Coefficient. Selected linear equations of regression are shown in Figure. 1 – 3.

Figure 1. Linear Regression Equation between  $N_{scj2015}$  and  $N_{um2015}$

Figure 2. Linear Regression Equation between  $N_{scj2015}$  and  $I_j$

Figure 3. Linear Regression Equation between  $I_j$  and  $N_{um2015}$

If we take out points corresponding to Moscow and Saint-Petersburg coordinates from the obtained linear equations, so for the Figure 1 we will obtain the equation  $N_{um2015} = 0.0209 N_{scj2015} + 7.2026$ ,  $R = 0.4938$ , for the Figure 2 the equation  $I_j = 0.0121 N_{scj2015} + 3.0722$ ,  $R = 0.6094$ , for the Figure 3 the equation  $N_{um2015} = 2.036 I_j + 0.5186$ ,  $R = 0.9529$

**CONCLUSION**

Thus, based on the example of 26 regions of the Central and North-West Federal Districts of Russia there was studied the mutual correlation between ten scientific-innovation and macroeconomic indicators in the article. Two indicators of innovation infrastructure and four indicators of university infrastructure and their activities, including Scopus-publication activity, were taken as scientific-innovation indicators. The Gross Regional Product and a number of population as well as their specific indicators (the Gross Regional Product per capita, population density) were taken as macroeconomic indicators. There was obtained a high pairwise correlations of all indicators between each other. It is obvious that the social-economic potential of urban regions determines their high scientific-innovative potential, rather than the reverse.

**ACKNOWLEDGEMENTS**

This research was done according to the Government task of the Ministry of Education and Science of the Russian Federation for 2016, project code - 516.
