Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Doctor of Philosophy

MICROBIOLOGICAL RISK ASSESSMENT OF *LISTERIA MONOCYTOGENES* IN MINIMALLY PROCESSED VEGETABLES

By

P. JEYALETCHUMI A/P S. PONNIAH

May 2011

Chairman: Professor Son Radu, PhD

Faculty: Food Science and Technology

The purpose of this study was to carry out a microbiological risk assessment on *Listeria monocytogenes* in vegetables that are consumed in the minimally processed state in Malaysia. The prevalence and number of *Listeria* spp. and *L. monocytogenes* were determined in raw vegetables from pre-harvest and retail level. Environmental samples of soil, water and animal manure were also obtained from vegetable farms. Characterisation of strains isolated from vegetables was carried out by phenotypic (antibiotic resistance) and genotypic (Random Amplification of Polymorphic DNA) methods. A kitchen simulation study was conducted to provide decontamination and cross-contamination data and information for estimation of the risk of acquiring listeriosis from consumption of minimally processed vegetables using a step-wise risk assessment as well as a stochastic approach using simulation software.

At the retail level, 306 vegetable samples were examined over a one-year period (February 2008 to January 2009). The prevalence of *Listeria* spp. was 33.3% while the prevalence for *L. monocytogenes* was 22.5%. *L. monocytogenes* was frequently found in yardlong bean (n=32) at 31.3% and Japanese parsley (n=33) at 27.2%. At the farm level, 50 vegetable samples were taken. Both *Listeria* spp and *L. monocytogenes* were detected in 16% and 6% of the samples respectively. Among the environmental samples (n=94), *Listeria* spp. and *L. monocytogenes* were detected in 47.6% and 38.1 (n=21) of soil samples; 77.8% and 61.1% of manure samples (n=18); 25% and 12.5% of environmental swabs (n=40). It was not however detected in samples of the irrigation water (n=15).

From the kitchen simulation study, it was found that the mean percent transfer rate from vegetables (n=45) to the wash water ranged from 32.4% to 60.2%, from wash water to cucumber was 24.9% to 66.3%; from vegetables to chopping board was 18.9 to 32.2%; from chopping board to cucumber was 5.4 to 75.3%. Washing of the vegetables in tap water caused a 0.3-log reduction of *L. monocytogenes* attached to the vegetables.

Characterization of 71 strains isolated from the 306 samples of vegetables was done by Random Amplification of Polymorphic DNA (RAPD). It was found that the strains could be grouped into 6 clusters and 1 solitary isolate. This shows that the strains that have been isolated demonstrate genetic variability and is of importance to the Microbial Risk Assessment as the different strains would have variations in virulence and pathogenicity. In terms of antimicrobial susceptibility, the Multiple

Antibiotic Resistance Index (MARI) of the strains ranged from 0.06 to 0.63. Only 14 % of the strains had MARI values higher than 0.2. MARI values less than 0.2 indicate strains from origins where antibiotics are seldom or never used. The importance of the antimicrobial study to the Microbial Risk Assessment would be that some of the strains exhibit multi-resistance to drugs used in the treatment of listeriosis.

The estimation of risk of acquiring listeriosis from consuming minimally processed vegetables was done using a deterministic and stochastic approach. An exponential dose-response model was used to estimate the probability of illness in low risk and high risk group of consumers. The estimated mean risk per serving for salads was 1.42×10^{-5} per 100 000 population for the healthy low-risk population. For the high risk group, the risk estimate was 1.23×10^{-2} per 100 000 population for AIDS patients, 3.55×10^{-4} per 100 000 population for diabetics and 1.09×10^{-4} per 100 000 population for the elderly population respectively.

The exposure assessment model was most sensitive to the input distribution describing the serving size. This implies that the serving size was the input parameter that most strongly influenced the risk and would be the primary control option in trying to reduce risk. In conclusion, a risk assessment has been conducted that can lay the foundation for more comprehensive studies as well as alert health authorities to be more vigilant about listeriosis especially among the vulnerable population.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

PENILAIAN RISIKO MIKROBIOLOGI KE ATAS *LISTERIA MONOCYTOGENES* PADA SAYUR-SAYURAN YANG DIPROSES SECARA MINIMUM

Oleh

P. JEYALETCHUMI A/P S. PONNIAH

Mei 2011

Pengerusi : Profesor Son Radu , PhD

Faculty: Sains dan Teknologi Makanan

Tujuan kajian ini adalah untuk menjalankan penilaian risiko mikrobiologi ke atas *Listeria monocytogenes* pada sayur-sayuran yang dimakan dan diproses secara minimum di Malaysia. Prevalens dan kuantiti *Listeria* spp. dan *L. monocytogenes* ditentukan pada sayur-sayuran mentah dari kebun dan di peringkat peruncitan. Sampel-sampel persekitaran yang terdiri daripada tanah, air dan baja dari haiwan juga diperolehi dari kebun sayur. Pencirian pencilan dari sayur-sayuran dilakukan secara kaedah fenotip (resistan antibiotik) and genotip ('Random Amplification of Polymorphic DNA'). Kajian simulasi di dapur turut dijalankan untuk memberikan data dan maklumat mengenai proses nyahkontaminasi dan kontaminasi silang sebagai anggaran risiko dijangkiti penyakit *listeriosis* akibat dari memakan sayur-sayuran yang diproses secara minima dengan menggunakan "step-wise risk assessment" dan juga pendekatan stokastik menggunakan perisian simulasi.

Di peringkat peruncitan, sebanyak 306 sampel sayur telah dikaji sepanjang tempoh satu tahun (Februari 2008 hingga Januari 2009). Prevalens *Listeria* spp. adalah

33.3% sementara bagi *L. monocytogenes*, prevalens adalah 22.5%. *L. monocytogenes* kerap dijumpai pada kacang panjang (n=32) dengan prevalens 31.3% dan sayur selom (n=33) pada prevalens 27.2%. Di peringkat kebun, sebanyak 50 sampel telah diambil. Kedua-dua *Listeria* spp. dan *L. monocytogenes* telah dikesan sebanyak 16% dan 6% dari sampel sayur-sayuran mentah. Di antara sampel-sampel persekitaran (n=94), *Listeria* spp. dan *L. monocytogenes* yang telah dikesan sebanyak 47.6% dan 38.1% dari sampel tanah (n=21), 77.8% dan 61.1% dari sampel baja (n=18), 25% dan 12.5% swab persekitaran (n=40). Walau bagaimanapun, tiada yang dapat dikesan di dalam air saliran (n=15).

Dari kajian simulasi dapur, purata peratus kadar perpindahan dari sayur-sayuran (n=45) ke air basuhan adalah diantara julat 32.4% hingga 60.2%.; dari air basuhan ke timun berada diantara julat 24.9% hingga 66.3%; dari sayur-sayuran ke papan pemotong berada diantara julat 18.9% hingga 32.2%; dari papan pemotong ke timun berada dalam julat 5.4% hingga 75.3%. Proses membasuh sayur-sayuran dengan air paip menyebabkan pengurangan sebanyak 0.3-log kandungan *L. monocytogenes* pada sayur-sayuran tersebut.

Pencirian 71 pencilan yang dipencilkan daripada 306 sampel sayur-sayuran telah dijalankan dengan kaedah 'Random Amplification of Polymorphic DNA' (RAPD). Didapati bahawa pencilan dapat dikelaskan kepada 6 kluster dan 1 pencilan tunggal. Ini menunjukkan bahawa pencilan menunjukkan variabiliti genetik dan ciri ini adalah penting kepada penilaian risiko mikrobiologi kerana stren yang berbeza akan menunjukkan perbezaan dari segi virulens dan pathogenisiti. Dari segi 'antimicrobial

susceptibility', 'Multiple Antimicrobial Susceptibility Index' (MARI) berada diantara julat 0.06 hingga 0.63. Hanya 14% dari stren mempunyai nilai MARI melebihi 0.2. Nilai MARI kurang dari 0.2 menandakan stren berasal dari tempat-tempat di mana antibiotik tidak atau jarang digunakan. Kepentingan kajian antimikrobiologi kepada penilaian risiko mikrobiologi adalah beberapa stren mungkin resistan terhadap ubat antibiotik yang digunakan dalam rawatan penyakit listeriosis.

Anggaran risiko mendapat penyakit 'listeriosis' dari memakan sayur-sayuran yang diproses secara minima dikira dengan menggunakan pendekatan deterministik dan stokastik. Model "exponential dose-response" digunakan untuk menganggarkan kebarangkalian dijangkiti pada kumpulan pengguna berisiko rendah dan kepada pengguna berisiko tinggi. Anggaran purata risiko bagi setiap hidangan ulam adalah 1.42×10^{-5} bagi 100 000 populasi penduduk bagi golongan sihat dan berisiko rendah. Bagi golongan yang berisiko tinggi, anggaran risiko adalah 1.23×10^{-2} bagi 100 000 penduduk bagi pesakit AIDS, 3.55×10^{-4} bagi 100 000 penduduk bagi pesakit diabetes dan 1.09×10^{-4} bagi 100 000 penduduk bagi golongan wargatua. Sebagai kesimpulan, sayur-sayuran yang dimakan dan diproses secara minimum didapati mempunyai keupayaan untuk menyebabkan penyakit listeriosis. Oleh itu, usaha pemantauan perlu dilakukan untuk memastikan sayur-sayuran ini tidak membawa mudarat kesihatan. Model 'exposure assessment' paling sensitif terhadap saiz hidangan. Ini menandakan saiz hidangan adalah parameter yang paling mempengaruhi risiko dan harus dikawal untuk mengurangkan risiko. Sebagai kesimpulan, penilaian risiko telah dijalankan yang merupakan asas kepada kajian

lebih lanjut dan ia juga dapat memberi kesedaran kepada pihak kesihatan mengenai penyakit listeriosis di kalangan penduduk berisiko tinggi.

ACKNOWLEDGEMENTS

The author would like to express her most sincere appreciation and gratitude to the Chairman of her Supervisory Committee, Professor Dr. Son Radu of the Department of Food Science, Faculty of Food Science and Technology for his invaluable guidance and encouragement throughout the course of the research. His constant advice and motivation has been instrumental in enabling the transcription of this thesis.

The author would also like to thank her co-supervisors, Associate Professor Dr. Cheah Yoke Kqueen from the Department of Biomedical Sciences, Faculty of Medicine and Health Sciences and Dr. Fareenazleen Mohd. Ghazali from the Department of Food Science, Faculty of Food Science and Technology for their invaluable guidance, encouragement and assistance throughout the course of the research.

The author would like to express her heartfelt gratitude to her laboratory colleague, Tunung Robin for her patience in teaching the microbiological protocol and analytical techniques used in the research and excellent technical expert assistance. She would also like to thank her laboratory colleagues, John Tang Yew Huat, Sandra Afriani and Dr. Chai Lay Ching for their technical expertise and assistance throughout the course of her study.

The author would like to thank her friends from the Centre of Excellence for Food Safety Research, Universiti Putra Malaysia : Lok Chui Mei, Margaret Selina Paie, Noorlis Ahmad, Indah Lestari, Mohd. Zarrul Nizam, Lee Hai Yen, Tuan Zainazor Tuan Chilek, Noor Hidayah bt. Mohd. Shahroni, Pui Chai Fung, Wong Woan Chwen, Elexson Nilian and Ubong Anyi for their technical assistance in all the molecular work.

Sincere thanks are also extended to Puan Noraini Bt. Dato' Othman, Director of the Food Safety and Quality Division and Puan Shamsinar bt. Dato 'Abdul Talib, Deputy Director of the Food Safety and Quality Division of the Ministry of Health for providing the funding to carry out this project.

Special thank is also expressed to the Malaysian Department of Public Services and the Ministry of Health for making it possible for her to undergo her Doctor of Philosophy programme at Universiti Putra Malaysia.

I certify that a Thesis Examination Committee has met on 27 May 2011 to conduct the final examination of P.Jeyaletchumi A/P S.Ponniah on her thesis entitled 'Microbiological Risk Assessment of *Listeria monocytogenes* in Minimally Processed Vegetables' in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia (P.U.(A) 106) 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

Mohd. Yazid bin Abdul Manap, PhD

Professor,
Faculty of Food Science and Technology
Universiti Putra Malaysia
(Chairman)

Fatimah binti Abu Bakar, PhD

Professor,
Faculty of Food Science and Technology
Universiti Putra Malaysia
(Internal Examiner)

Mariana Nor bt. Shamsudin, PhD

Associate Professor,
Faculty of Medical and Health Sciences,
University Putra Malaysia
(Internal Examiner)

Tom Ross, PhD

Associate Professor,
University of Tasmania,
Australia
(External Examiner)

NORITA OMAR, PhD

Associate Professor and Deputy Dean
School of Graduate Studies
Universiti Putra Malaysia

Date: 23 August 2011

The thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirements for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

Son Radu, PhD

Professor
Faculty of Food Science and Technology
Universiti Putra Malaysia
(Chairman)

Cheah Yoke Kqueen, PhD

Associate Professor
Faculty of Medical and Health Sciences
Universiti Putra Malaysia
(Member)

Farinazleen Mohd. Ghazali, PhD

Senior Lecturer
Faculty of Food Science and Technology
Universiti Putra Malaysia
(Member)

HASANAH MOHD. GHAZALI, PhD

Professor and Dean
School of Graduate Studies
Universiti Putra Malaysia
